

Parasocial Hell

We talk to people around the world like they are friends through the internet, but do they really know who we are? <https://digit.in/sep18-47-1>

Farting Security Guard

This security guard became an Instagram star by documenting his farts - now he wants to go professional. <https://digit.in/sep18-47-2>

bad and the absence of performance graphs from the presentation seemed logical. If this is all that the card can do, then it was no wonder that they didn't show any performance graphs. This video turned viral pretty quick prompting a response from the developer stating that it was an early demo and the FPS issues would be sorted by the time the game released. However, later it was revealed that Shadow of the Tomb Raider will not release with Ray Tracing as a feature. It will only be added as a patch much later. How

on earth do I interpret this in a positive manner?

So things started adding up, the absence of graphs, SoTR releasing without ray-tracing and the month long wait time to before actual benchmarks could be released were all making the new Turing cards appear to be bad. I've had this nasty habit of pre-ordering but up until now, I've only pre-ordered to ensure that I had the product or game on launch day. Up until the keynote started, I was pretty determined to be the first among by

circle of geeks to own a 20-series card but never have I felt this conflicted. So, the answer is no. I'm not going to pre-order a 20-series card for myself. I'd much rather wait for benchmarks to feel confident about my purchase decision rather than regret losing my hard earned money. The last rumour I heard mentioned September 14th as the day the embargo for the 20-series ending. That's when I'll decide to get myself an RTX 2070. Because right now, there's no way I'm paying for such an enigma. 

BUYING ADVICE

GAMING LAPTOP 60-70K

Q Hi Agent001,
I am from Electronics and telecommunication branch. This is my first year but I will send resume to you guys for the internship in later years. I really want to work with you guys.

Now, let's come to topic.

So softwares required would be basic like codeblocks. I also have to run Ubuntu along with Windows. From next year I will be coding for microcontrollers like Arduino. And I think Matlab will be also required in later years.

I generally like playing for shooting games like COD, Battlefield. Also, I like Assassin's Creed (that's why my every IGN is Altair) and Far Cry. I don't like racing games.

I don't have a specific brand in my mind that I want laptop from that brand only.

But if there are good options from MSI then I will go for it.

Acer AN51-52

And I think more, should I purchase laptop online or offline? Because lots of my friends are going for offline market. I don't have any problem buying anything online but it will depend on offers.

Once again thank you guys.

Waiting for the next month magazine eagerly.

—Tushar Ranjan

A Hey Tushar,
None of the software you've mentioned are intensive enough to warrant a high-end laptop. The games, however, are quite intensive. It is for this reason that we'll focus on the graphics card in the laptop. Within your budget of 60-70K, you can't get any laptops with an 8th Gen Core i5 CPU and an NVIDIA 1050 Ti graphics card. The sole exception seems to be the Acer AN51-52 which costs about 74-76K. However, on Paytm mall you can get a cash back which ensures that your net expenditure comes below 70K. Here's the model number - NH.Q4951.001

If you want MSI, then there is the GF63 8RC-211IN. You get practically the same configuration with the exception of the graphics card which is the NVIDIA 1050 instead of the 1050 Ti. You can always wait for the next e-commerce sale for better prices. There should be some sales around Diwali, so watch out for those. We look forward to hearing from you with regards to the internship.

OVERCLOCKED 8700K

Q Dear Agent001,
I'm getting an Intel Core i7-8700K CPU and I plan to overclock it. What kind of CPU cooler should I get? I didn't get any cooler with the 8700K because it is an unlocked CPU so I thought I might as well ask you guys for a good recommendation.

—Avinash J

Cooler Master MasterLiquid ML 360

A Hey Avinash,
Your choice of cooler depends on how much you plan on overclocking your CPU. With the 8700K, it can hit 5 GHz on air cooling quite easily. So if that's all you're going to do, then getting a good air cooler should be more than sufficient. Noctua makes really efficient air-coolers so you can look towards getting the NH-D14 or the NH-D15.

If you're planning on going further than 5.0 GHz, then try getting an AIO. The NH-D15 beats a lot of AIOs in terms of cooling efficiency so you will have to look towards the more premium AIOs. The Thermalright Water 3.0 and Cooler Master MasterLiquid ML 360 are very good in that regard.
