Fallacy Advertising?

Not used just in online arguments, logical fallacies can be used to market stuff to you. Find out how to avoid falling for them.

A

lbert Einstein once said that insanity was doing the same thing over and over again and expecting different

results, but what he didn't realise is that most of us normal people fall into that category. We all have our comfort zones, our habits, and yes, even our biases, and it all adds up to us making the same mistakes over and over again. Whether it's being a fanboy for a product, not learning from past mistakes when making impulse purchases, always shopping from the same online store despite knowing others may be cheaper... we constantly do things that may not work out to be the best decision in the long run.

Anyone who has been in a serious argument online (and that's almost everyone on social media these days), will be aware of the logical fallacies that people use to support their arguments. Even if you didn't know that they were called "logical fallacies", you will still recognise the fallacies we list here, because they're so common.

Now if you think those first two paragraphs just don't link together at all... that's what this third paragraph is for... Making use of our biases and

using logical fallacies to do so is what marketing gurus do best. Some very smart people are paid a lot of money to take advantage of our inbuilt flaws, and sell us products at prices that are exorbitant. However, it's not just companies who are doing this, it's other users as well, especially fanboys, and the shocking thing is that, unlike companies, they do so for no personal benefit at all. Heck, you might be guilty of doing the same yourself! We hope this article can help you spot these fallacies when you see them, and not just point them out, but stop committing them yourself.

AD HOMINEM

The ad hominem fallacy, which translates from latin to "against the man", is pretty straight forward. It's an act of attacking a person's character, instead of responding to an argument made by the person. More often than not, this fallacy is used in arguments along with some of the others that will follow it in this article.

In the tech world, you will come across this more from people you argue against. For example, when people used to debate Windows vs. Linux, a common argument against Windows was that it made Bill Gates rich, or that he stole some idea from someone, or something along those lines, which had absolutely nothing to do with whether Windows was better or Linux. Sometimes companies also use ad hominem against each other. They're usually as snarky ads, even going as far as making fun of each other's user base! When no one really has anything truly better to show off, you end up with such tactics.

STRAW MAN

This is usually a tactic used in an argument where a person builds up a flawed argument on behalf of an opponent, and then proceeds to counter it and point out the flaw, thereby giving people the illusion that he/she is victorious. Think of it as erecting a dummy of your opponent, made of straw, and
