

Rad Power Radwagon

While most electric bikes can now offer practical speeds and charging times, they lack the carrying capacity of cargo bikes. The ones that do come with a good carrying capacity are often bulky and quite expensive. Rad Power's Radwagon finds a sweet spot between all of this.

Hold on, you might be thinking that it's too steep a price to pay for a bike, but the specs will convince you otherwise. The Radwagon packs a 750W Shengyi direct drive hub motor with regen braking and a 48V 14Ah (672Wh) Lithium-Ion battery using Samsung cells that has been rated for 800 charge cycles. It can carry a payload of 350lbs, or roughly 160kgs and can reach top speeds of upto 32kmph. That's two average adults at the average speed of roughly any motorcycle in the city. The bike itself weighs a light 32kgs and can reach an estimated 40-70km on a single charge. It also sports a snazzy Full LCD display including speedometer, wattmeter, and odometer. And compared to its closest counterparts, it is cheaper by \$1500.

The Radwagon may not be the right bike for a long rides on the weekends, but it will surely do the job as your daily driver around town. The bikes are so popular, that at the time of writing, they were out of stock.

PRICE: \$1599

RollerMouse Red Wireless

At Digit Labs, we are always on the lookout for better ergonomics from items of everyday use - be it through a new chair with lumbar support (can it do thiiiiiss?), an alternative keyboard layout, or even a paradigm changing mouse. RollerMouse Red Wireless can easily be a perfect example of the last one. Coming from Contour Design, RollerMouse is a lineup of mice that is designed to provide better support to your arm than a typical mouse while also enhancing productivity.

It looks like the wrist support pad that comes with a number of mechanical keyboards. The bar on top holds a sliding roller, and it is a combination of this sliding and rolling action that lets you control the cursor. There are six programmable buttons on the mouse that supports DPI from 800 upto 2400. You also get a wired variant as well as a number of accessories that let you get different variations on the hand support. The Red, shown here is the premium product in the lineup.

Panasonic MS-DS100

Tired of your shoes stinking like the worst thing in the world? Beyond the usual airing and Naphthalene balls, there is little you could do.

Most of these approaches do not really get rid of the smell anyway. Now, technology could have a more cutting edge way out for you. The Panasonic MS-DS100 is a shoe deodorizer that aims to take the stink out of our footwear while you relax.

The product requires you to plug it in and place the bottom nodes onto your shoes. The device then blasts charged ions into your shoe, which go through the material and disperse any odor lurking in there. While the normal mode runs for five hours, the long mode runs for seven hours.

According to Panasonic, the long mode is to be used when their is particularly high concern about the smell or pollen presence. There are six outlets to spread the 'nanoe X' particles in all directions inside the shoe. The device is designed to have a low energy consumption footprint. The product is set to be available in September, in Japan only (no surprises there) and there's no details on pricing yet.
