

Search Engine for Scientists

Google has launched a Dataset search engine to make it easy for scientists to find the datasets they need <https://digit.in/oct18-14-1>

Sculptures from videos

A new system uses an algorithm that can convert 2D videos into 3D printed motion sculptures <https://digit.in/oct18-14-2>

gets recited to me when I prepare dinner. I say, Digit has become our bonding glue.

Oh yes, our favourites are Level up, Dmystify and of course Agent 001. We love the Entire Team Digit.

—Tinku Bhattacharyya

d Wow!!! That's by far one of the most touching letters we have received in a long time. To be able to have reached out to two generations of your family is amazing enough, but for you to actually call us your bonding glue, well that's something truly honorable for us.

Although Agent 001 never responds to emails directly, we are happy to pass on any message or questions you have for him. Thank you so much for your mail, because it will inspire us for years to come.

Letter of the Month

The article "Fallacy Advertising" was wonderfully enlightening. I was so enlightened that I could invent the fallacies committed by Team DIGIT.

Refer Sub-Head "Appeal To Authority" under the article. The statement "For technology, Digit is a truly unbiased source, because it can only be of use to readers (customers) if it remains totally unbiased" commits the fallacy of Petitio Principii (Arguing in Circle).

If I give a twist to the above statement, it will bear an example of another fallacy called "Fallacy of Complex Question" - asking a question in such a way as to presuppose the truth of some conclusion buried in that question. Here it goes - How come DIGIT successfully maintains to be truly unbiased source for technology whereas others fail at it?

Real examples of it are "Let us hear from the experts that why X brand toothpaste gives you better protection and whiter teeth than others"

I have intentionally said above that 'I could invent (not discover) the fallacies committed by DIGIT', only to emphasise that irrespective of DIGIT committing any logical fallacy or not, it's an indisputable fact that DIGIT is truly an unbiased source for technology. DIGIT is not merely a computer magazine but truly a complete magazine for technology, which not only truly represents, portrays and depicts the current flow of the digital world but also predicts to a larger extent the future course of the stream ahead.

It is not a magazine about only computers, mobiles, cameras etc. It does not get into the hardcore science and technology blings either. It neither delves deep into the ocean, nor does it soar sufficient enough to touch the solar epicentre, yet it scrapes and scoops enough material from the surface of each which is presentable, comprehensible and useful to a common reader like me to make sense out of the Greek and Latin of the world of science and technology. It adequately covers only that much of scientific and technological advancement as would be sufficient enough to understand and make best use of it, which encompasses and engulfs me in my day to day life, yet not fully aware/literate about it. It makes my everyday life safer, smoother and smarter.

The article "Good Guy Dark Web" is such an eye opener for a less computer-literate-reader like me. The articles like "The Artistic Skills of Animals", "Not So Super'stitions", "Hacking the Planet", "Fighting mosquitoes with tech", "Strange ISS Experiments", "Light Bending" etc. are really superb supplements for my quest ridden starving soul. DIGIT is a wholesome entertainment and a wholesome diet for my mind.

Irrespective of criticism and complaints about the contents of your magazine (not being true hardcore computer/software oriented), I believe you should continue producing, with an adequate dosage of evolution, what you have been doing so far. I am a subscriber since beginning (June 2001), without any break so far. I have seen it really evolving in its journey of last 18 years. The evolution is not an enigmatic evolution, but an evolution, made possible only through conscious, constant, tireless and systematic efforts, which is conspicuously discernible from its gracious growth graph. I wish all the Best and I convey my sincere thanks and deepest regards to the Team DIGIT.

P.S.- Please let me know if there's any way to read the editorial article "Weird is good", though I enjoyed it too, without being able to read it, but still, I should not be left behind, if you really meant it to be readable.

—Tanmaya Behera

Hi Tanmaya, That's the longest most entertaining email we have gotten in a long time! Thank you so much for taking the time to send that, and thanks so much for being a subscriber from the very beginning!

The text is merely mirrored, and thus using a mirror one can read it. Of course, being geeks we don't have mirrors, or want to use them, but we have selfie cameras on the front of our phones, or image editing software.

Either click a pic of the page with the front camera on your phone (with mirroring set to off), or just click with the back camera and use any image editing tool to flip the image horizontally.

About the logical fallacies, you're very correct, because it's nearly impossible for regular folk like us to not commit them on a daily basis, and that was the point of the article as well... to point that out.
