A COLLECTION OF PRO TIPS FOR EVERYTHING. Without being limited to a particular topic, these tips are from popular software, to coding, to browsers, search, storage rules, password rules, mobile device hacks, bios cracking, tweaks explained and everything tech under the sun.

Must try iOS 12 features

The new software update brings in a lot of tiny and big features to iOS. We take a look at some of our favourite ones.

SINCE IOS 12 WAS DE-PLAYED to the public after sitting in beta, we are pretty sure most of you might have updated your iOS devices. Now that most of us are running our iPhones (and iPads) on iOS 12, let's explore some of the most interesting features and a few tips on using the latest piece of software from Apple.

SET UP GROUPED NOTIFICATIONS

All these years, every single notification on iOS devices would stack up and create an endless list if you were among the popular ones. iOS 12 onwards, your notifications will be grouped together just like Android. However, you will get much more control than what Android offers currently. Grouped notifications is a default feature and if you wish to tweak around with it, then you can do so by opening up the appropriate app and going to Notifications. The advantage here is that you get to decide whether you want all the notifications bundled together or based on individual users. For example, if you're using

WhatsApp on Automatic, your text messages will have different stacks for individual users. If you switch that to By App, then all your text messages will be grouped into a single stack. You can switch off grouped notifications completely to go back to the old list.

DISABLE LOCK SCREEN NOTIFICATIONS

Apple has also included quick settings for notifications right on those notification stacks. All you need to do is use Force Touch to activate the quick settings where you get two options to "Deliver Quietly" and "Turn Off...". The first option will send the notification directly to

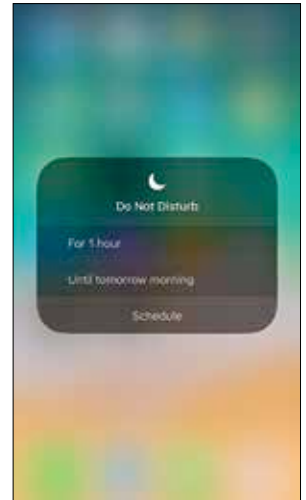

the Notification Center and the second one will mute its notifications entirely.

USE A VIRTUAL TRACKPAD TO MOVE THE CURSOR

Traditionally, to edit text, you would have to tap the specific area and then begin typing again. On iOS 12, this process becomes a single step. Force Touch on the keyboard while typing and the keyboard will turn into a virtual trackpad. Now, you can drag your finger on the virtual area to move the cursor to wherever you want in the text body.

SET ADVANCED DND MODE

The Do Not Disturb feature got a tiny but useful update. Now, you can switch your device to the DND mode right from the Control Centre. You have to Force Touch the DND button that will pop up a list of options depending on the time of the day and location. For example, if it's the night time, it will ask you whether you want to enable the mode for an hour or until morning or according to your fixed schedule. This can be added from the Settings app along with enabling or disabling other important options. You can also enable the new Bedtime feature that has been introduced in iOS 12 where the lock screen dims down and all your calls will be silenced while your notifica-

tions will directly appear in the notifications centre. Pro-tip, use the DND mode to keep notifications away when you're recording your device's screen.

CREATE CUSTOM SIRI SHORTCUTS

Siri Shortcuts is aiming to save your time by using voice commands. Several apps including the system default apps already support this feature. Head over to Settings > Siri & Search > Suggested Shortcuts > All Shortcuts. Here you will find all the possible shortcuts from your installed apps listed. If you want to create a shortcut for view the latest headlines in Google News, go to Settings > Siri & Search > Google News > Shortcuts. You will find a few shortcuts listed including one to "Read the latest headlines". Tap on the plus sign and record a
