

voice command to trigger this shortcut. After the recording is saved, you can enable Siri and repeat the recorded command to read the latest headlines. Imagine having to do this manually by scrolling to the Google News app and then firing it up. It's way easier now.

ENABLE SHORTCUTS FOR POWER USERS

If you want to push the limits of automating your tasks, download the Shortcut app. Similar to IFTTT and Workflow, these apps let you trigger one or a series of events based on your needs. You should check out the curated library where you will find already created shortcuts before creating your own. The best thing is these shortcuts can also be linked with Siri Shortcuts giving you voice control over them.

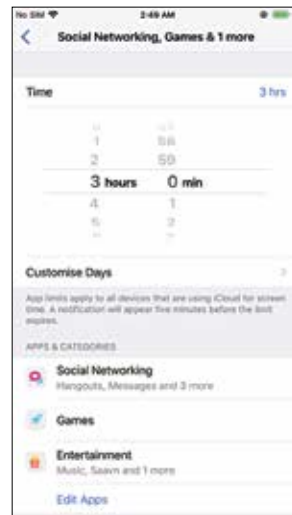

LIMIT YOUR APP USAGE

Apple's new Screen Time feature allows you to cut down the time you spend on your iOS devices. Setting up App Limits will enable you to limit the usage of certain

apps based on the categories or all the apps. Go to Settings > Screen Time > App Limits. Here you can either choose all the apps and categories or pick multiple categories which we guess would mostly be Social Networking, Gaming and Entertainment. Next, you will add the time limit you want, say three hours, and you're done. You can set the time limit for different days as well. If you cross three hours of usage, you will be locked out of the app. If not categories, you can also setup time limits for individual apps by tapping on the Screen Time widget and opening the desired app.

Apart from individually controlling the time limits, you can also enable Downtime to restrict using your phone except the emergency apps. All you need to do is

select the essential apps that you need to be enabled during the downtime by selecting Always Allowed from Screen Time. Then head over to Downtime in the previous menu and schedule the time away from your screen. Enjoy your peace of mind away from your phone. **4**
