

Oneplus 6T gets in-display scanner

The Oneplus 6T will come with an in-display fingerprint scanner as teased by the company in its promo video. <https://digit.in/oct18-31-1>

Ghostery Browser gets an Update

Ghostery, the privacy focused browser, is getting a much needed revamp for the first time in years. <https://digit.in/oct18-31-2>

Choosing the right license is important

any place where your community can gather to interact with you and each other to solve their queries and discuss the project. That being said, there are certain things that can help it.

2.1. Creating a website: A single location for all your resources, documentation, tutorials.

2.2. Go where your project's audience is: Depending on the problem you're trying to solve, this could be StackOverflow, Quora, Reddit or dedicated forums. Discuss your project with these people and take feedback. Offline conferences and meetups are also great for the same reason.

2.3. Share and contribute to other projects: Quid pro quo, but organic.

STEP 3: GET PEOPLE TO STICK AROUND

You're done with Step 1 and 2, people are showing up to your project. Now,

how do you get them to stay and engage? For starters, being responsive helps. A Mozilla study found that contributors who received code reviews within 48 hours had a much higher rate of return and repeat contribution. Try to solve raised issues as soon as possible. Accept contributions as much as possible and when you cannot, explain your rejection with proper documentation.

3.1 Transparency

We cannot stress how important transparency is. After you've made your project open source, at every stage you need to ask yourself if your work can be public, whether it's a WIP update, takeaways from a meeting and more. If many people are running into the same issue, make it a part of the README. Set up notifications on all popular platforms to alert you whenever your project is discussed.

3.2 Privacy

However, certain things merit from

having private channels, such as security issues and serious code of conduct violations. Ensure that people have a way to inform you about these privately. Also, adopt a zero tolerance policy towards bad and harmful actors.

3.3 Encourage newcomers

For known bugs and issues, it could be helpful, especially for newcomers to your project, if you label them according to difficulty level, for e.g "first timers only", "good first issue", or "documentation". Going for 'first timers only' contributions is a great way to encourage people into your project while creating goodwill and reputation for it at the same time.

3.4 Resolve conflicts

As the number of people involved in a project increases, tempers are sure to rise. Create a conflict resolution mechanism that is precise and well documented - via voting, moderators or any other method of your choice.

STEP 4: MAKE MONEY (IF YOU WANT TO)

As your project grows in popularity and sustains an active community, you can find yourself (or others involved) contributing more than 10 to 20 hours per week. As a result, it is quite natural to expect to be compensated for these efforts to sustain oneself. The potential for compensation also opens up the doors of open source to people who wouldn't be in a position to volunteer otherwise.

The first source to do this is your employer. A lot of companies are developer and open source friendly and would be glad to allow you to use company time and resources to further your open source project, especially if they use the technology/library themselves. You can also crowdfund your project, like Vue, Redux and schema migrations on Django. There could also be paid tiers to your project for dedicated support, hosted options and paid versions of your project. Check out this detailed guide on how to get paid for your open source project: <https://github.com/nayafia/lemonade-stand>.
