Benchmarks obtained on the OnePlus 5T

apps running in the ‘Recent Apps’ screen were also cleared. It was ensured that the browsers had only one tab opened and every benchmark was run on a single tab.

Additionally, we used the HTML5 Test to determine the extent of HTML5 support that the browser supports. This test is more of a checklist to see whether all the standard and related

HTML5 specifications are supported by the browser. It doesn’t test how well the browser supports them or how functional they are.

Security and privacy

While performance is an important factor in a web browser, security and privacy are of top priority. In this comparison, we tested the browser’s SSL and TLS capabilities using Qualys’ SSL Labs Client Test. Support for the latest Secure Socket Layer and Transport Layer Security protocols enables your browser to prevent any hacker from snooping on the data being exchanged between the server (website) and the client (you). This test lists down support for all the protocols under SSL and TLS. In the recent past, a few SSL and TLS vulnerabilities were discovered including Logjam, FREAK and POODLE. The test shows whether the browsers still consists of those vulnerabilities.

Panopticlick is a great tool to verify whether your browser’s fingerprint is unique or not. A browser’s fingerprint is generated based on the configuration data and settings in your web browser sent to websites. Together they can form a unique fingerprint that websites can use to track you and maybe even create your unique profile on their website. If your fingerprint is more unique, it becomes easier for websites to identify your behaviour on the internet. This doesn’t even include cookie information and that’s why you can’t avoid this by disabling cookies. Panopticlick tells you whether your browser protects you from fingerprinting and how unique your fingerprint is. The tool also tells you whether your browser blocks online tracking technologies used on websites.

OBSERVATIONS AND RESULTS

Every time we’ve conducted system-wide comparison tests, we have always come across interesting observations on the behaviour of products. The Android web browser comparison is no different. Starting off with performance, Basemark Web 3.0 is an inten-

XIAOMI MI 5 OVERALL PERFORMANCE				
	Basemark Web 3.0	Dromaeo JS Test	Speedometer 2.0	HTML5 Test
