

Android in every car

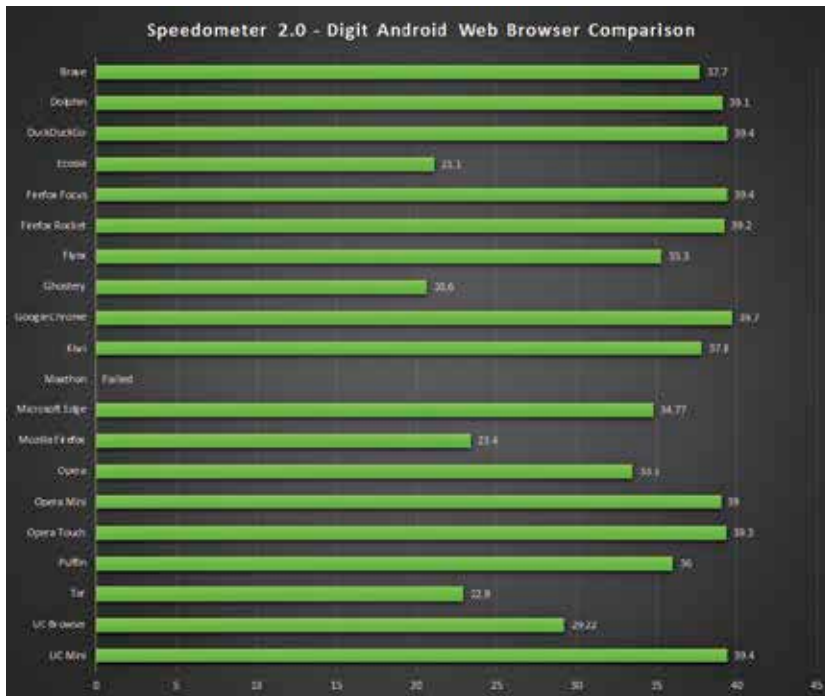

Google has partnered with the Renault-Nissan-Mitsubishi Alliance to bring Android systems in their cars. <https://dgit.in/oct-18-37-1>

GIF support on Instagram

Android and iOS users can now send GIFs through Direct Messages on Instagram. <https://dgit.in/oct-18-37-2>

Benchmarks obtained on the OnePlus 5T

sive benchmark and not every browser was able to handle it. The browser would either crash or would be stuck at certain tests, especially the WebGL 2.0 runs. Puffin and Tor failed in this test.

We had some interesting observations in Dromaeo's JavaScript Test. Opera Mini disables JavaScript from running in the default state with Ad Blocking turned on. We had to disable

this feature in order to run the test. The most surprising was Puffin's score in this test. Their scores were astronomical compared to the rest. This is possible because it's a server-side browser so the rendering and loading are happening on Puffin's remote servers. This offloads all the work from your phone to their servers to load web pages. We verified the difference in JavaScript benchmark with another tool called JetStream 1.1 by BrowserBench between Puffin and a few other browsers. We found a similar pattern of achieving almost double the score compared to the others on Puffin. However, this comes at a cost where Puffin failed in all the Panopticlick privacy tests.

Speedometer 2.0 checks the responsiveness of the browser with keyboard and touch input. Only Maxthon failed in this test in the first keyboard input run. The browser wasn't able to move beyond this run and got stuck with the keyboard every time.

In the privacy test, only Tor came out as the one blocking all kinds of trackers and supporting fingerprinting protection.

VERDICT

Considering the case of Puffin which achieves an extremely high score in the JavaScript benchmark, it's more of an outlier case because of its implementation. If we're solely speaking of JS performance, Puffin beats all. However, in this comparison, we are trying to evaluate a balanced performance on several aspects other than just JS performance. Hence, we've decided to keep Puffin aside from the final result.

The scores of both the devices were considered and weighted to calculate the winner of this comparison. Brave Browser strikes the best performance among the 20 browsers that we tested. It generates great scores across the board in performance, HTML5 support, security and privacy. Kiwi comes in second place and Firefox Rocket sits in third place. Write in to let us know which browser you're going to be using as your daily driver.
