new API and developers need a lot of time to implement it and get good FPS. The former is dev responsibility and the latter is mostly NVIDIA's. From what we saw with Shadow of the Tomb Raider, RTX is not at all in shipping condition. Coming towards DLSS, there seems to be no proper justification for it to not be present.

The worst crime here is that these promised features are the primary reason for charging a bomb. Yes, new technology costs money and it should. R&D isn't for free. But if you're taking my money, I better have what you've promised. Since the responsibility for implementing these technologies does not lie with NVIDIA, they're off the

hook. Otherwise, we'd be hearing of multiple class-action lawsuits already. Honestly, this is a great lesson for everyone who pre-ordered the new cards without waiting for the benchmarks. It serves you right to lose money, that too a ridiculous amount, for something that just doesn't work out of the box the way it was meant to be played *snicker*.

BIOS BRICKED

Q Hi, I am your subscriber for more than 10 years or so, I have come across a problem with my motherboard bios. I have an Intel DH77EB motherboard (which is discontinued now) and I was trying to install a new graphics card on this board. But the card was not accepted so I tried to update to BIOS of the motherboard. I ran the BIOS executable file (which was downloaded from the Intel web site), but unfortunately the update failed due to an unknown reason (as there was no message while running the exe file).

Now when I switch on the desktop PC, nothing happens on the screen, there is no display. The BIOS options are also not displayed. I am stuck up now, please help me out.

Bricked? There's a way out

A Hey Vinayak, It would appear that you've successfully managed to brick your motherboard. An interruption during the BIOS update process will sometimes corrupt the BIOS depending on what time the

interruption happened during the BIOS update process. Fortunately, there is a chance that you can fix your issue by changing a jumper on your motherboard and settings it into BIOS Recovery Mode. Simply download the BIOS file onto a flash drive. Ensure that the flash drive is formatted as FAT32 before copying the BIOS onto the flash drive. Also, the file should be copied onto the root of the drive i.e. not inside any folder. Switch off your PC completely. Then pull the jumper on your motherboard which is used to set the BIOS configuration mode. This should be situated to the left of the onboard speaker of your motherboard i.e. the Intel DH77EB. Now insert the flash drive into a USB 2.0 port on the rear of the motherboard and switch it on. The motherboard should automatically access the USB drive and reflash the BIOS. If all works out well, your motherboard should be back to normal. If not, you'll have to take it to the service centre who will charge you for the process since the 77-series chipsets are EOL (End-of-Life). PHONE FOR ₹20K

Q Dear Sir, I am currently the owner of a Sony Xperia M smartphone. I am proud of its camera (both front and rear). But it has got low app space and the sluggishness is too much. I want to move to a new one by selling or exchanging it. This time I want a phone with better camera, more RAM, expandable micro sd card slot, super fast, bigger screen and price between 15,000 and 20,000. I have shortlisted some models and here is the list:

- Nokia 6
- LG Q6+
- Moto G5S Plus
- Redmi Note 3
- Mi A1
- Sony Xperia XA1

Can you please tell me the best phone for me among these? If there is a better phone which meets my criterion but is not in my list please tell me. Also please tell me the site from where I can exchange the old one for a new one. I am a resident of Chinsurah.

You can't go wrong with the POCO F1

A Hey SP, I don't think you can go wrong with the Xiaomi POCO F1 right now. It's got a decent camera, huge screen and is super fast because it packs a Snapdragon 845. It has 64 GB of storage space and there's also the option of adding a microSD card to get more space. However, 64 GB is a lot and I honestly, don't think you'll need more than that for most use cases. The POCO F1 costs ₹20,999 which is a bit out of your budget but with sales happening every other month, I don't think getting the phone should be an issue.
