Teardown: Apple iPhone Xs and Xs Max

Same old but with some real hidden "innovations".

Gigabit LTE

Symmetry fanatics might already be rioting over the bottom edges of the iPhones. The left mic-holes have been reduced to three. This sacrifice has been made to accommodate another antenna band for Gigabit LTE giving a significant speed boost.

Camera upgrade

The cameras received an update with a 32 per cent increase in the wide-angle sensor size. Another improvement is the increase in the pixel size that enables better low-light photography and the Smart HDR feature, something Google had already delivered with the Pixel 2 camera.

Dual-SIM support

It's 2018 and Apple finally has added dual-SIM support on the iPhone. However, the traditional approach is only for Chinese models. The rest of the world (including India) will have to do with a physical SIM and an eSIM. Airtel and Jio support eSIM in the country, so these two service providers are your only options.
