

Lyd

Funding: \$105,027 pledged of \$30,000 goal

Link: <https://dgit.in/Lyd>

One of the most mortifying things that can happen to a geek is an unexpected liquid spill all over your desk, ruining your gadgets, collectibles and more. Introducing Lyd, a bottle designed to prevent the problem of accidental spillage. You can say goodbye to accidentally spilling liquid all over your desk or gadgets thanks to its patent pending lid. While the company hasn't detailed exactly how the lid works, it claims that the bottle will start pouring only at the touch of authorised lips, and not, say, from an accidental lick from your pet dog or from a colleague trying to steal a sip of your special coffee brew.

The lid provides 360-degree access, as shown in an animated render on their Kickstarter page, that allows the liquid to flow through once your lips are on the lid's surface. The bottle also uses renewable material to reassure your eco-friendly side. It supports wireless charging and supposedly charges to full power in just four hours, and also supports manual operation once it runs out of (electronic) juice. The vacuum insulated chamber keeps your drinks hot or cold for hours and is also durable due to its use of double walled steel.

Langogo

Funding: \$13,853 USD raised of \$10,000 goal

Link: <https://dgit.in/Langogo>

Universal language translation has been a goal for quite a few devices. The feature on the Pixel Buds have seen mixed reception and nobody else has really tried it in the mainstream. So, it is expected that a dedicated device to do this can generate a fair bit of excitement, especially if it is capable of a number of other actions as well. Meet Langogo, a device that claims to translate between more than sixty languages in less than one second, both ways. Before we go into the features, it suffices to say that this delicate looking device has been thoroughly tested for durability. It comes with polycarbonate, Asahi glass and capacitive screen on its build.

The translation feature also allows you to save the translation on screen as text, and also switches to the local language automatically as you arrive at a

destination. It also comes with dedicated noise cancelling hardware to cut out ambient noise from your conversations while you're on the go.

Apart from translation, Langogo packs an AI assistant EUri to help you achieve simple tasks while you're travelling. Also, without requiring a local SIM-card, the device helps you stay connected to Wi-Fi based on the best local network wherever you travel, including hotspot support. This ensures that you don't lose access to its translation capabilities even when you're on the go. Packing a 2200 mAh battery, the Langogo promises to give you 6 hours of usage, which should be good enough for most local runs.

This device should be a good overall travel companion especially if you're travelling to foreign shores where language comprehension might be a serious issue.

JNC Nano Combo

Funding: \$31,690 pledged of \$63,699 goal

Link: <https://dgit.in/JNCNanoCombo>

If you're particular about your clothing and like to maintain them in a crisp, wrinkle-free state, you must have faced the problem of not being able to carry around a clothes iron everywhere, due to the bulk or other factors. You can say goodbye to that problem with the JNC Nano Combo. The Nano Combo is a tiny, power-packed steam iron that aims to solve that problem by providing a tiny and portable solution.

Weighing a measly 450 g, the iron measures a tiny 118 x 81 x 97 mm, essentially fitting in the palm of your hand and can still feature a 65 ml chamber for storing water. The iron can generate steam within five seconds of powering up and only needs to preheat for 30 seconds. A small cost of the tiny form factor is a mere 5-10 minutes of usage, but that's enough for a shirt and pair of trousers.

You get four modes to control the temperature, ranging from dry ironing to deep steam care between 80 to 200C. The company also claims that the steam generated consists of smaller 'nano' particles that penetrate deeper into all kinds of fabric and provide better sterilization than normal steam irons. While those claims can only be verified once someone gets their hands on the actual finished product, it's still pretty useful. You can snag one at just \$68 (approx).
