

VAZIRANI SHUL

INDIA'S FIRST UBER-AMBITIOUS HYPERCAR

The Vazirani Shul's design prioritises looks first, but that in no way means it will lack in performance

Souvik Das | feedback@digit.in

It's not an everyday business to build hypercars. Even the global giants renowned for it - Koenigsegg, Pagani, Aston Martin, McLaren and the gang spend massive amounts of money, ingenuity and manpower to build super-exclusive and extremely fast cars. The difficulties are many - with R&D costs and engineering expertise being at the top. Still, if the early signs are anything to go by, homegrown newcomer Vazirani Automotive's first hypercar concept, the Vazirani Shul, is quite an impressive start.

WHAT IS IT?

The Vazirani Shul was born out of one man's ambition to put India in the map of hypercars, and raise the standards of homegrown industries. The key to the

concept car is its jet turbine-powered electric powertrain, which attempts to address the issue of heavy battery packs being deployed presently in all-electric supercars. This turbine is placed in a carbon fibre suit for heat dissipation and latency purposes, and is essentially an onboard generator.

When in motion, this generator helps recharge batteries faster when on the go. It is this factor that Vazirani hopes will help the car reduce charging times required, and with the prospect of on-the-go charge regeneration, should not only maximise total range, but also

provide more and uniform power to the electric motors that power the wheels. This turbine is placed in the same format as a mid-engine sports car, and the overall car is heavily inspired from the present crop of extreme supercars like the Ferrari LaFerrari, McLaren P1 and Porsche 918.

The concept design of the Vazirani Shul is how the company wants the eventual production form of the car to look like. Additionally, special emphasis has been put on the romance of owning special breeds of cars, and as a result, the design is a tribute to legendary hypercars like the Jaguar F-Type. Further technical details are in the shadows as of now, but if it does make it to produc-
