

tion, it will presumably come with a whole bunch of technologies onboard like torque vectoring, radar-based driver assistance systems and multiple electronic assist systems to help bring out the most of the hypercar's potentials.

WHO ARE THEY?

Founder and chief designer Chunky Vazirani is the key person behind Vazirani Automotive. Having previously worked at Rolls-Royce, Jaguar and Volvo, Vazirani's premise is to build India's first hypercar while focusing on design. Upon the concept's unveiling at the Goodwood Festival of Speed, Vazirani stated, "We believe outright beauty has become very rare nowadays as visual complexity and 'designed by engineering' supersedes the art element that made millions of people, including me, fall in love with cars. The look shouldn't be a consequence of engineering. For us, the design process spearheads the car's

development to make sure we achieve the right balance between the art and science. It was exhilarating to design the Shul because the new electric technology gave us the opportunity to rethink the architecture. The proportions are a reflection of the technology packaged underneath. Smaller components and extra room allowed us to creatively channel the air through and around the car to reduce drag and improve downforce. With this design, we wanted to bring back classic automotive elegance but still execute it in a modern, relevant manner and we are really pleased with the final outcome."

Founded in 2015, the company is based in Mumbai, with a team based in Los Angeles. It is presently working with a wide number of partners for working capital, engineering and development expertise and sourcing all components, with major partners based in UK, USA, Japan and Italy. It is also supported in terms of designing and performance

pro prowess by Kazunori Yamauchi of Gran Turismo and Michelin, and is also backed by India's Formula One team, Sahara Force India.

WHAT OTHER CARS ARE THERE LIKE THIS?

The most prominent electric hypercar right now is Croatia-based upstart, Rimac. Largely made famous following Richard Hammond's high speed crash in the company's first all-electric production hypercar the Rimac One, the company has since come out with a second edition of its all-electric hypercar, the Rimac C_Two. With claims like longer range, the usual range of equipment and luxuries, and a claimed 0-100 kph time of less than two seconds, Vazirani will have its sight set on Rimac on how to conceptualise and develop all-electric hypercars.

Tesla, too, is in the fray. The company's latest generation of the tri-motor Roadster is yet another all-electric hypercar, and while it has already picked up criticism for its 200 kWh battery pack claim, there's no denying that it is one of the very rare few right now that are showing a possible picture of making the present-day Ferraris and Lamborghinis obsolete. It, too, claims less than two seconds to reach up to 100 kph, which may well become a mainstream claim once all the electric hypercars start hitting the roads.

WHEN MIGHT I ACTUALLY SEE ONE?

There is no word just yet on the Vazirani Shul's production potential. That said, it will be incredibly cool to actually see the Shul make it to production, and with a considerable range of financial and engineering houses backing them up, we remain extremely positive about the possibility of seeing a Vazirani Shul on the road.

Up until now, the two notable India-born supercar designs have been the DC Avanti by popular car designer Dilip Chhabria, and the TaMo RaceMo, which unfortunately never made it to production. While we leave you with all the photographs of the Vazirani Shul, here's wishing them all the very best, and hoping that they do indeed make it to production.
