

Mirror

You can sign up on any number of fitness apps and strap on a number of fitness wearables, but as most fitness enthusiasts would tell you, there's nothing like actually being in a class. However, technology might soon be able to bridge that gap from the comfort of your home with a mirror. No, not the one in your room. We're talking about The Mirror, from Curiouser Products Inc. It does so by bringing a live instructor on the full size mirror+screen, complete with speakers, right into your living room.

When powered off, you could easily mistake it for a standard mirror, at 22" wide, 52" high and about an inch deep. On the other hand, it transforms into a tech infused LCD display when powered on, controllable through a companion app. In a typical session, the user will be able to see a live stream of the instructor on the display, along with other information such as heart rate and more depending on the additional gadgets the user has put on. For instance, if you're wearing a heart rate sensing wrist band that is paired with the setup, you'll be able to see your heart rate on the display while you're working out in real time.

The names of other people taking the class at the same time are also on the screen, so that you don't miss out on the companionship that a lot of people enjoy at a gym for. The included camera and microphone also allow the possibility of personal training to exist, with initial offerings already in place. The catch? It'll set you back by a whopping \$1,495, with paid subscriptions to the fitness classes coming at an additional premium separate from the price of the device. Yeah, not exactly a typical gym class replacement. Perhaps we should stick to the actual gym around the block... as if!

Predator Thronos

Do you consider yourself the king of your own gaming realm? Acer's new Predator Thronos is a gaming chair that defies the 'chair' tag and could very well be the Iron Throne if the Game of Thrones was about the PC Master Race. At IFA 2018, Acer debuted what they are calling a 'gamer's cave' and we don't see how they are wrong. For starters, the over-head brace supports three 27 inch monitors as well as integrated space for a Predator PC. With motorized controls for being able to adjust the monitor setup and a steel structure, the whole thing weighs a whopping 220 kgs approx. And it lights up in full glory.

For comfort, the seat is adjustable up to 140 degrees and comes with a foot rest. So, for those long gaming marathons, you not only have a dedicated cave for yourself now, you have one that is also ergonomic and comfortable. The seat also vibrates, but rather than comfort, its purpose is to make gaming immersive on the Thronos since the vibrations are in sync with in-game events. Say hello to complete immersion.

To fit the Thronos, Acer also announced a couple of gaming monitors at IFA and a gaming PC. Even without these additions, it would be foolish to expect the Thronos to come cheap. But then, how would something cheap be fit for the kings, eh?
