

Carrial Vasco

Losing stuff isn't uncommon, especially if you're a geek who has ten things to ponder at the same time ranging from the fate of the Skywalker family after episode IX to the workings of the molecules in carbonated water. Hence, it is only natural that bags – you know, places where you keep stuff so that you don't lose them – are trying to help you not lose stuff. The Carrial range of bags comes with a GPS based tracker that helps you keep track of the whereabouts of your bag wherever you are.

On the surface, the Carrial Vasco is a pretty standard, all-purpose bag. It comes with a handy set of slots, including ones catering to storing mobile phones, tablets, laptops, bottles, cameras, and even hooks to suspend your glasses on. While the build quality is quite average, it's not the build that makes it worth talking about.

Apart from the tracking functionality, you also get a USB port on the exterior of the bag which can be connected to a power bank (not included) inside the bag to help you charge your devices without keeping your bag open. The GPS tracker itself is not attached to the bag and can be used completely independent of it. The tracker itself can also be used to locate your phone by creating a loud noise from it, even if it's on silent mode. However, beyond this, there's little that justifies the near ₹5k price tag that the Carrial Vasco comes with, since the number of bags today come with the powerbank charging feature. You could pretty much go for a standard GPS locator off of Amazon and use it with your normal bag instead.

Prana Air Motion Mask

If your daily routine involves staying outdoors frequently and your city has terrible air pollution, you probably use an air mask already. Or rather you should be using one. While a regular air mask might do the job for say PM10 and sometimes PM2.5 particles, they could struggle when trying to keep out particles at anything lower than that. Prana Air wants to give the air masks an upgrade with their Motion Mask that features a motorised fan and a five-layer protection from air pollutants. It isn't unusual to have more than a single layer of protection in an air mask. However, an actual rotating fan in your air mask isn't that common. The advantage of a fan pulling in fresh and filtered air is higher air volume than the average human intake. Although there are five layers, it comprises three different types of filters. The first filter is more of a pre-filter that stops big particles from entering. Then there are two activated

charcoal filters to get rid of toxic gases. Two more HEPA filters are used to filter out the tiny PM1 dust particles. We tried the mask for around an hour or two with the fan switched on. There wasn't too much moisture build-up and the company says that this is because of micro-ventilators in the mask. That is definitely a plus point towards the build of the Prana Air Motion mask.

If you're wondering about the fan, then it runs for about six hours on full charge, which should be good enough for an average working day, even if you're stuck in heavy traffic for a major part of your commute. Even though the battery has a tiny 480 mAh capacity, the mask will take about 1.5 to 2 hours to fully charge. The box ships with a micro-USB charging cable. You can cycle through three speeds of the fan that can be controlled using the buttons on the bottom according to your requirements.

The mask is agnostic of the head size because of the adjustable foam head strap. However, the shape of your face might affect how well the mask fits on you. It fits snugly on your face and with the right kind of fit, you will be able to jog while wearing it as well. The part which sits on your face is made of "medical-grade silicon" so it does tend to take the shape of your face, which makes it a comfortable wear even for extended use.
