

### Machine-Learning based shopping

Amazon's Scout is a machine learning based shopping tool that offers a Pinterest like feel for browsing products. <https://dgit.in/oct18-94-1>

### Fraud-Detection AI

Researchers have found a new way of implementing Machine learning in banks, to detect fraud. <https://dgit.in/oct18-94-2>

# We are Venom

These are the most poisonous substances in the world. Stay as far away as possible.

Arnab Mukherjee | [arnab@digit.in](mailto:arnab@digit.in)

### Botulinum toxin a.k.a Botox

**LD50: 1ng/kg**

**Produced by: Clostridium botulinum**

Widely agreed to be the most toxic substance known to man, the ratio of the lethal quantity to a grain of salt is the same as the ratio of the weight of an average person to 27 blue whales. Yet, we administer it to ourselves more frequently than you would imagine. Among different variants, botulinum toxin type A is the most toxic. It works by preventing the release of the neurotransmitter acetylcholine at the junctions of your nerves and muscles. In its more well known avatar Botox, this exact property is used to disable and relax certain muscles that cause wrinkles.

### Tetanospasmin a.k.a Tetanus

**LD50: 2.5-3ng/kg**

**Produced by: Clostridium tetani**

Before we put you into doubt about that last tetanus shot you got, let us make it clear that the vaccine given for tetanus is based on derived toxoids, which are far less lethal to the human body. While rust itself doesn't cause tetanus, objects that acquire rust are usually found in the outdoors, exposed to moisture, feces, soil and provide a suitable environment for C.tetani to thrive. However, the misconception has prevailed and we still mostly get a tetanus shot only from metallic cuts. Infection leads to muscle spasms that can be severe enough to cause bone fracture and even death.

## LD50

In toxicology, LD50 is the measure of the toxicity of a substance, known as Median Lethal Dose. It is the dosage of a substance that is enough to kill half the members of a test population after a certain duration. It is expressed as the mass of the substance per unit mass of the test subject, usually as milligrams per kilogram. For this article, we've used the lowest LD50 values for each substance across different methods of administration.
