

Getting started with Ember.js

A step-by-step guide on how to build a simple app on Ember.js

Arnab Mukherjee | arnab@digit.in

Anybody delving in the developer circles in recent years would know about the framework wars. We now have so many JavaScript frameworks that its become something of a joke. However, some of these frameworks have been around for a while and have enjoyed steady popularity. We've covered a lot of them in this section. This time around, it is Ember.js that takes our focus.

WHY EMBER?

According to its stated objective, and popular user feedback, Ember.js is a framework to develop "ambitious web

applications". This is not limited to single page web applications but also includes desktop and mobile apps. Some of the most notable platforms running on Ember are NASA's homepage, Apple's user guides and Apple Music app, or even NYC's land zoning and use app. Ember's official webpage even claims that Microsoft, Netflix and LinkedIn use the platform in some way. What makes one chose Ember? Here are three things that work for Ember:

- **Future proofing:** Ember supports the Babel JavaScript transpiler

which allows the use of future JavaScript standards through transpiling for use in today's browsers.

- **Convention over configuration:** Ember has been built with developers as the highest priority so it comes with a lot of useful APIs that speeds up app development so that developers can focus on development rather than efficiency.
- **Vibrant addon ecosystem:** Ember allows the consumption of add-on code from within the project and allows overwriting its methods and properties.

So, without further ado, let us see how we can get started with this framework.

REQUIREMENTS

Before you install Ember, you need to ensure that a couple of dependencies are met. These would be:

- **Git:** Git is required by Ember for dependency management While macOS and Linux users get it by default, Windows users can install it from here: <https://dgit.in/GitWin>.
- **Node.js and npm:** Since Ember CLI is built with JavaScript, it requires the latest version of the Node.js runtime. Additionally, it requires npm for dependency fetching.

Let's get to the installation.

*CODING MATTERS

*Baidu breakthrough

STACL (Simultaneous Translation with Anticipation and Controllable Latency), is an automated system that is able to conduct high quality translation concurrently between two languages. <https://dgit.in/BaiduTrans>

*Nematode worm parks a car

The researchers that had virtualised a worm brain, made it learn how to balance a pole have now taught 12 neurons in its brain how to park a car. <https://dgit.in/NemaCar>

*Linux is back

Linus Torvalds, the creator of Linux and the person who steered it to its current position of world domination, is back as the Chief Linux Maintainer after a month long break from the project. <https://dgit.in/LinusBack>
