

Noise isolating Voice Assistant

A MIT based startup developed Yobe a smart assistant that uses AI and microphones to isolate speech from a crowd. <https://dgit.in/nov18-30-1>

Amazon Rekognition used by ICE

Amazon has pitched its face recog tech to the U.S. Immigration and Customs Enforcement agency. <https://dgit.in/nov18-30-2>

This comprehensive provision is what makes Ember a straightforward and efficient tool for application development. Even though you haven't really built anything yet, you can still check if what you have, works properly. To do so, **cd** into the **ember-quickstart** directory and run the following command:

```
cd ember-quickstart
ember serve
```

This is to check the development server. Along with some dependency warnings, the output you see should look something like

```
Build successful (7923ms)
- Serving on http://localhost:4200/
```

Now, go to <http://localhost:4200/> and you should see the Ember landing page. Congratulations on building your first Ember app. But we're far from done. Let us change some basic application configurations. Go to the **app/templates/** directory and open **application.hbs** in an editor. Change its contents to the following:

```
<h1>FoodTracker</h1>
{{outlet}}
```

You will notice that the page for your app has also updated to reflect the change. The **{{outlet}}** tag means that any nested route will be rendered in that place. We will see how to use it later in this article. For now, let us see how to define a route.

DEFINE A ROUTE

Let us build an app that lists food (always a good idea). The first step in that direction would be to build a route. Without complicating things much, think of routes as the pages that make up your app. To make one, you can use a generator, which is Ember's way of fast-tracking boilerplate code for common tasks. At this point, open a new command line interface (so that you don't have to stop the server that is running your application) Use this code to do so:

```
ember generate route food
Where the output will be something like
installing route
create app\routes\food.js
create app\templates\food.hbs
updating router
add route food
installing route-test
create tests\unit\routes\food-test.js
```

Essentially, this tells you that Ember has created:

- A template that will be displayed when the user visits **/food**.
- A Route object that fetches the model used by that template.
- An entry in the application's router (located in **app/router.js**).
- A unit test for this route.

Go to the templates folder and edit

the **food.hbs** file and add the following HTML there.

```
<h2>List of Food</h2>
```

Now, in your browser, go to <http://localhost:4200/food> and you should see your **<h2>** below the **<h1>** you had added earlier.

This means that the food template is now rendering, so let's give it some data to render. To do so we have to specify the model for that route which can be done by editing the **food.js** file under the **routes** folder. You need to add a model method to the route which should look like this:

```
import Route from '@ember/routing/route';
export default Route.extend({
  model() {
    return ['Pizza', 'Pasta', 'Paratha'];
  }
});
```

Here, you've specified what data the model method will return to the template. If you need to fetch data asynchronously, the **model()** method supports any library that uses JavaScript Promises. Now, you need to tell the template how to use that array of strings. Go to the food template and add the following code.

```
<ul>
  {{#each model as |food|}}
    <li>{{food}}</li>
  {{/each}}</ul>
```

*POINTERS

*EmberSchool

A comprehensive paid online Ember training program. EmberSchool focuses on real world skills that you'll use in your job, not just theory. Almost 200 videos, exercises, Challenges, Projects and more. <https://dgit.in/EmberSchool>

*The Ember Times

Official newsletter of the Learning Team of Ember.js. This is where you will get updates as to what is new with the Ember platform from a learning perspective. Sign up! <https://dgit.in/EmberTimes>

*YoEmber

An Ember.js tutorial from the absolute beginner level. At the end of the course some advanced topics are also explored. The objective of this tutorial is to build a complex web application. <https://dgit.in/YoEmber>
