Motorola One Power

Reliable and functional

The Moto One Power, in its bid to compete fiercely, packs a relatively newer Snapdragon chipset under the hood, along with a notched display to keep up with changing times. But what is really appreciable is the massive 5,000 mAh battery. The Snapdragon 636 is good enough for daily tasks like using social media, binging on Netflix, playing the occasional games, etc. With Android One certification, the phone runs on stock Android Oreo with no bloatware taking up extra space.

The phone manages to capture good photos in bright sunlight. There are ample details in the photos with high contrast making the highlights stand out from the rest. In low light conditions, the colours turn out pretty fine and the details are acceptable, but the noise is just too much to share on social media. Theoretically, the front camera is capturing more details of your face, but the results aren't quite satisfactory. The details look smudged if you zoom in even a little.

This phone is one of the best attempts at making a value-for-money phone by Moto in a long time. It gives everything one looks for in a mid-range device — Adequate processing power, lag-free experience, regular updates and a long battery life. It's surely quite bulky and the block-like design doesn't help with the ergonomics at all, but that's really the only trade-off if you're looking for a phone that's reliable. The Nokia 6.1 Plus, Asus Zenfone Max Pro M1 and the Xiaomi Redmi Note 5 Pro are all similarly powerful, but the One Power edges all of them out in terms of battery life.

Apple iPhone XS 512 GB

Brilliance at a huge price

There's absolutely no fault to be found with the iPhone XS display. We played

Fortnite, Asphalt 9 and a bunch of indie-games like Monument Valley 2, Rings and Ridiculous Fishing without the iPhone XS breaking a sweat. The device barely got warm during our 30-minute spurts of gaming sessions. Even photo editing was a breeze, including editing RAW files in Adobe Lightroom.

Overall, the camera performance of the iPhone XS is splendid, scoring well into the top league. While the camera app itself offers quite a number of features, the best way to get the most out of the iPhone XS's sensor would be by using a third party app like Halide or Camera +2.

You get a 2,658 mAh battery which, Apple claims, is going to last you 30 minutes more than the iPhone X. The battery life on the iPhone XS isn't the best in the league it competes in.

The iPhone XS is an absolute beast when it comes to performance. The new A12 Bionic chip performs far beyond what the Snapdragon 845 today is capable of. The display is definitely serious eye-candy and the cameras themselves are great. What's not so great is the battery life, and the price tag of ₹1,34,900, which seems far too high for a smartphone. While this is definitely a powerful device, it is hard to justify spending so much. The iPhone XS isn't for everyone. It is for those who can actually afford the price tag.
