have built-in GPS and this might call for a larger budget.

Lastly, I don't need the ability to make calls from my tracker. Notifications are welcome but not crucial. So I really don't need a full-fledged smart-watch, a simple fitness tracker that's accurate and lightweight and, has built-in GPS is what I'm after. I found

that the Samsung Gear Fit2, Garmin Forerunner 235 and Polar M600 fit the bill. There's also the Fitbit Surge. The Gear Fit2 doesn't have a great battery life and the Polar M600 is a bit difficult to come by. Given the app ecosystem I have which is primarily Android centric, I need something that can interact with Google Fit or

Strava or should have the ability to export data. The Forerunner 235 and Fitbit Surge because of their better battery life and compatibility with my apps end up being the final contenders. Fitbit has a more polished app than Garmin, so that's what I'll be going with. I'll keep you folks posted on how that goes.

BUYING ADVICE

RYZEN 2ND GEN BIOS

Q Hey Agent001! I'm building a Ryzen 2400g budget PC but I have a problem regarding the motherboard. All 300 series AM4 motherboards requires a bios update for 2nd gen Ryzen support. I'm unable to find an updated BIOS motherboard offline as well as online. The 400 series motherboards are quite expensive. Please help.

—Lakshya Jeet J

2nd Gen Ryzen processor

A Hey Lakshya, There are a couple of things that you can do here. You can always talk to your local vendor and ask him to update the BIOS for you. Most vendors have unboxed CPUs lying around, so they can easily get this done for you. This is the easier method. If you'd rather not do that, then you can always talk to the AMD RMA folks and explain the situation to them. AMD even has a program where they loan a CPU to you so that you can perform the BIOS update first. You have to show proof

of purchase for the CPU as well as the motherboard and AMD will ship a cheap APU along with a heatsink for you to power the motherboard up and perform the BIOS upgrade. Once you are done with the BIOS upgrade, you can insert your 2nd Gen Ryzen processor and return the loan kit back to AMD. This is a free service provided by AMD for this very purpose. Google - "Short Term Processor Loan "Boot Kit"" to know more about this service and how you can go about getting your own update done. I would still say that talking to the vendor would be the simplest of all these methods.

POWER SUPPLY NEEDED?

Q Hey Agent001, I'm building a gaming PC and this is the configuration that I'm planning to buy:

- CPU: Ryzen 7 1700
- Motherboard: Msi A320M PRO-VH PLUS
- RAM: G.Skill F4-3000C16S-8GISB 8GB 3000MHz
- HDD: Toshiba 1TB DT01ACA100
- DVD: NA
- Graphics Card: ASUS GTX 1050 Ti 4GB GDDR5
- Monitor: BenQ GW2480 24-inch IPS
- Cabinet: Intex

The cabinet that I got was recommended by my dealer and it came with its own power supply unit. One of the persons standing in the shop told me that this power supply is not going to be good enough to power my graphics card but I checked the wattage online and found that a 450W power supply is good enough. So

should I get a different power supply or continue using this one?

—Vinayak Yewale

A Hey Vinayak, You haven't provided us with the details of the included power supply so there isn't much for us to form a proper answer so we'll keep this simple. Your

Building a PC for BBQ purposes

GTX 1050 Ti ordinarily has a peak power draw of around 75 W. So ideally, yes, the 450W power supply will technically be sufficient. However, the quality of the components on the inside could mean the difference between you owning a brand new PC and you owning a brand new fried PC. We simply cannot count the number of instances that we've come across where poor quality PSUs have caused the graphics card or multiple components to go up in smoke. This happens more times than we'd like to admit. So it's always advisable for you to get a better power supply. You know the saying, better safe than sorry. We don't know of your budget so we're going to recommend that you get a 450W power supply from the likes of Cooler Master, Corsair, Seasonic or FSP for your system.
