

THIS IS TECHNOLOGY, CULTURE AND SCIENCE WITH A DIFFERENCE, AND THAT DIFFERENCE IS USUALLY ENOUGH TO MAKE MOST NORMAL PEOPLE GO "WTF?"

ALT this month:

What would it be like to wake up 300 years in future? Check out our Future Feature to get a somewhat grim idea. After that rude awakening, head to the Origins section to calm down by learning about the very first LOL. Or maybe tickle your fancy with our Infoporn section featuring a monster hunting map.

Chocolate Drone

Mechanical Engineering students at Duke university made a drone out of chocolate for a friend's birthday. The frame, rotors and blades were off the shelf components, but the fuselage was made from chocolate, and was edible. To keep the integrity of the drone, the chocolate was strengthened with vermicelli.

WHAT'S NEW

Why you peep at other people's phones

On a typical daily commute, it is almost impossible to ignore sneaking a glance at someone else's screens.

These screens are a window into the private lives of strangers. You are almost casually introduced to the instant messengers, social networks, videos and games of absolute strangers. Many people may even feel guilty after staring too long at these screens. Even if you look elsewhere, chances are, that your eyes will get attracted to another device. The act is known as "shoulder surfing", which was so far considered a vector of compromising security. Password fields replace the text with asterisks to prevent someone from casually learning your

password. So far, the studies on shoulder surfing have focused around computers, but the behaviour is much more widespread because of

smartphones. People may be shoulder surfing without intending to, or even being aware of the term. Now, a team of researchers has studied the meaning, impact and consequences of this behaviour, in the context of smartphones.

Your IQ is irrelevant

Ongoing results from the longest study in psychology clearly goes to show that the results are really not that relevant. The study originally began in 1921, and is ongoing to this date. The approach was to take a small group of the brightest students according to IQ tests, and track their progress through life, to match up how the IQ numbers match with their careers. The results are pretty disappointing. None of the students who

were the brightest in the group, went on to become well known geniuses. Two of the students who were part of the study, went on to helm the study itself. However, both of these are not

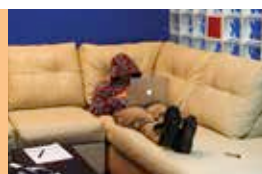

distinguished names in the field of psychology. Essentially, IQ has little to do with success and failure. Additionally, scrutiny of those who were or weren't successful did not track with the IQs that they did obtain in the tests. One of the candidates who was not considered bright enough to qualify for the brightest group in the study (Luis Walter Alvarez, pictured here), actually went on to win a Nobel Prize.

Designing a peeler

The development of the Oxo vegetable peeler is a case study on how industrial design for the edge cases, actually helps benefiting most people. Since coming into the market, the peeler has changed the way products are designed for kitchens. The approach of "inclusive design" has proved itself over three decades.

Automated jobs

The article looks at people who have silently, without the knowledge of their superiors, automated most or all of their jobs. They now go to office, sit comfortably, and pretend to be working, while the computers do all the work. You'll be surprised to learn how much some of these people earn!

Archeologists find vampire burial

At an ancient Roman burial site in Italy, archeologists have found the skeleton of a 10 year old, of unknown gender, with a brick in its mouth. The brick had been placed there to prevent the dead child from rising from the grave. There is evidence to suggest the child died of malaria.
