

Real time navigation sharing on iOS

Google Maps's ETA sharing feature which lets the app share realtime navigation route has come to iOS. <https://digit.in/nov18-81-1>

Alexa will whisper to you

Alexa has just got a Whisper Mode which allows her to receive whisper commands and whisper back in reply. <https://digit.in/nov18-81-2>

Blue Screen of Death

- Startup using 'Last Known Good Configuration' to undo recent driver or registry changes.
- Use system restore to undo all the recent system changes.
- Roll back recent driver updates.
- Check if there's enough free space on the primary drive.
- Check system for viruses.
- Apply all pending patches and updates for your system.
- Update drivers for hardware.
- Check the System and Application logs in Event Viewer for errors or warnings.
- Return hardware settings to default in the Device Manager.
- Return BIOS settings to their default levels.
- Reseat components, test memory and HDD.
- Update your BIOS.
- Special tip: Disable the automatic restart on system failure option to be able to read STOP code properly.

Won't Start in Safe Mode/Stuck at Startup Options

- Try every startup method available.
- Repair Windows installation.
- Try a system restore from the Advanced Startup Options.
- Use System File Checker (sfc) command.
- Reseat and test components.
- Re-install Windows.
- If Windows starts with low-resolution video enabled then try to adjust the screen resolution to something more comfortable and see if the problem simply goes away. If not:
 - Setup a working monitor from another computer and try it in place of yours.
- Update the drivers of the video card.
- Test your computer's memory and replace the memory if tests show any problems.
- Switch to integrated graphics if your processor supports it and you were using a discrete graphics card
- Replace the video card if your processor doesn't come bundled with integrated graphics.

Powers up, that's it

- Check your monitor, its connections and cables
- Clear the CMOS by reseating CMOS battery or by using motherboard jumper.
- Follow all points for 'Powers up then dies'.

Stops/Freezes/Reboots during Windows Startup

- Try manual power off then power on.
- Restart your computer if you can successfully get into safe mode.
- Repair your Windows installation.
- Use Last Known Good Configuration or System Restore to undo recent changes.
- Check HDD cables, CMOS.
- Reseat and test components.
- Perform a clean install of Windows.

Computer stops with an error message

- Document the error message in its entirety.
- BOOTMGR is missing. Press Ctrl + Alt + Del to restart : digit.in/BTMGR .
- Hal.dll is missing or corrupt. Please re-install a copy of the above file: digit.in/HalDll
