

Soundbrenner Core

After laying claim to the first wearable for musicians with Pulse, a vibrating metronome for your wrist, Soundbrenner has come up with a more powerful wrist-based wearable with Core. This one packs a number of essential music tools into the usual form factor of a smart-watch. Along with a watch (thankfully), the Soundbrenner Core retains the vibrating metronome from the Pulse and adds a Magnetic Twist Tuner and a Decibel Meter. While these tools need no explaining for the musically inclined, in case you're not, then you wouldn't want anything to do with the Soundbrenner line of products anyway.

Along with the standard variant, you can also go for a slightly more expensive Steel variant that is an aesthetic upgrade. If you're thinking that these four tools, in terms of performance, give nothing more than their traditional counterparts, think again. You get features like visual tuning, multi-instrument tuning, tap tempo, DAW integration, a rhythm coach as well as support for showing push notifications as usually seen on wrist-based wearables.

The watch sports a good build quality with IP66 certification and boasts of a 3-day battery life which should be more than enough for even the most demanding touring circuits. The display is a dual OLED 0.68" touch sensitive unit, while the control mechanism resides in the rotating outer ring and a couple of menu buttons on the side. The software is also a strength with the Core with its metronome tool boasting a huge range of music-oriented features. For the magnetic tuner, just rotating the watch face counterclockwise pops it off to be attached to your instrument for a portable, reliable tuner. We're definitely no musicians, but having all these music tools on your wrist seems quite handy to have if you're a budding musician.

Dyson Airwrap

Styling yourself often involves going to great lengths to get the exact look you've imagined for yourself. However, this quite easily, and frequently, leads to painstakingly long sessions of working on your hair, makeup, clothes and rest of your grooming. So, if any gadget comes along that aims to make any aspect of this process easier, it is bound to get a lot of attention. Dyson's Airwrap is a hair curler that shuns high temperatures for air, using an phenomenon called the Coanda effect to wrap hair around itself.

This is the effect that makes jet streams stay attached to a convex surface. As described by Henry Coanda, "the tendency of a jet of fluid emerging from an orifice to follow an adjacent flat or curved surface and to entrain fluid from the surroundings so that a region of lower pressure develops." Think of it like a sleeve that forms around

the tube of the Airwrap. When the hair approaches this sleeve, it wraps around the sleeve structure automatically.

Powered by the Dyson V9 motor, the curling rod has perforations that allow bursts of air to follow its curvature, which creates a difference in air pressure powerful enough to pull in hair that is close to it. Inside, a 13-blade impeller spins at speeds up to 1,10,000 rpm generating a force of up to 3.2kPa.

It comes with a host of attachments to achieve a range of outcomes, starting with the simple dryer that 'takes the hair from wet to damp' where it becomes suitable for styling. That makes this device useful in multiple use cases, namely ones where it just has to dry the hair and not style it at all. If only hair would be perfect to go more often – but then, where would we justify a hair styler based on a complicated physical phenomenon?

Along with different sized standard barrels, the attachments also include different sized volumizing and smoothing brushes, giving a lot of styling options to the user. Dyson claims a significant amount of R&D and engineering work has gone into the design and construction of the Airwrap and sports an appropriate price tag to show for it. While multiple combinations of the attachments along with the Airwrap base go for \$499, the complete set will set you back by a cool \$550.
