

NASA floppy disks in space

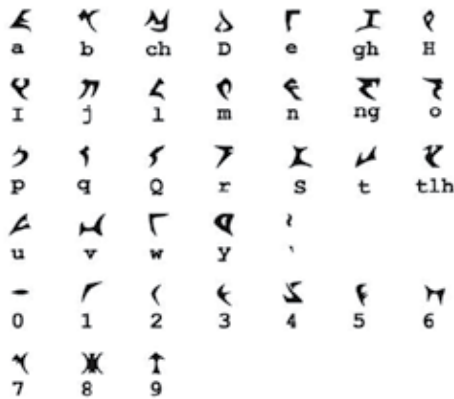

An ISS astronomer found floppy disks inside a locker at Space Station that hadn't been opened in a long time. <https://digit.in/dec18-115-1>

Racist AI model

Faception, developed by ML company Tel Aviv, made an AI model that tells your personality from facial structure. <https://digit.in/dec18-115-2>

GEEK-KEY

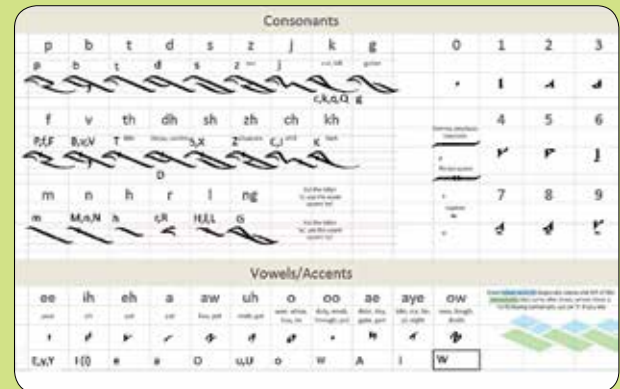

KLINGON

This is perhaps the most well known and intensely studied fictional languages. You can actually take a course in learning this language. The fans had to laboriously map the letters with the sounds by watching the shows, to figure out the script. In the Star Trek shows, the alphabets were asemic, and just thrown in randomly to form sentences, and if you try to decipher them, they do not make any sense at all.

TENNOBET

Tennobet is another elegant script, and is from Warframe. Tennobet is clearly inspired from and shares a number of features with Tengwar. The consonants are written in line, with the vowels appearing as diacritics above the consonants that come after them. Multiple vowels can be stacked diagonally, one on top of the other. If there are vowels following the last letter of a word, they can be stacked in free space, or optionally written over a silent h.

CIRTH

In the Middle Earth Legendarium, the early Dwarvish runes are called Cirth with an expanded set of letters known as Angerthas, and were initially intended to write in Sindarin, an Elvish language. Tolkien even developed a version of Cirth to be specifically used for writing in English. The runes are inspired from a real-world rune set, known as Elder Futhark. Now learning Elder Futhark, or Futhorc first is highly recommended. You are bound to score high marks in at least one OWL subject. You will be able to read runes wherever they appear in the wild – such as magical amulets or Marvel movies showing Asgardian artefacts. Cirth is an expanded version of Futhorc.

DOVAHZUL

Dovahzul is the script for a language introduced in The Elder Scrolls: Skyrim. There is no official name for the language or the script, but the fans call it Dovahzul, which means "Dragon-Voice". The script is also referred to as Dragon Runes. The sentences can either be written in the same way as the Roman script or can be centre aligned with a new line for each sentence. In the lore, the script is similar to the marks a dragon could make on stone walls. There is actually a real-world alternative to this language, which is ideal for writing on clay tablets, called the Cuneiform script.

TENGWAR

Tengwar is perhaps one of the most beautiful constructed scripts, and has been adapted for writing in various languages, including Arabic, English, Icelandic, and even High Valyrian from A Song of Ice and Fire. The script is written in various modes depending on the language used. For example, there is a difference between how the same Tengwar is used to write Quenya and Sindarin, two elvish languages.
