

SECURITY WATCH

Amazon data leak

Days before the hottest e-commerce day of the year internationally, Amazon admitted to a data breach that revealed customer names and email IDs to the public domain. The leak, revealed days before Black Friday, was apparently not caused by a breach of Amazon's website or its other systems, but a technical error that posted the details to its website. Amazon has declined to disclose the scale of the breach but said that they've emailed every user affected by it. Cyber-security experts have said that this leak is less severe than some other leaks where card details had been revealed, but that doesn't mean that affected users can relax. A brute force attack is good enough to break into the email IDs of most people as using simple passwords is still a widespread security malpractice. The breach is also a testament to the fact that a company like Amazon is also prone to being careless with user data, often comprising of highly confidential details and location information.

MOBILE WATCH

Nubia X

ZTE has created a phone with two displays! The Nubia X, launched on October 31, sports two displays - a 6.26-inch, FHD+ full bezel-less primary display and a 5.1-inch HD+ AMOLED rear display. The primary display achieves the coveted bezel-less state by eliminating the front camera and relocating both cameras to the back since users can now click selfies on the rear screen. The wacky device also sports two side-mounted fingerprint sensors. ZTE claims that each scanner will be used to unlock a particular display. The Nubia X features the popular flagship-level features of 2018, but it also does much more. It attempts to reinvent the monotonous trends of the smartphone industry. The device will release in India on December 11 with a speculated price of ₹34,960.

APP WATCH

Gweek

Speaking is a talent, especially public speaking. Not all of us are great orators, in fact, a lot of us stutter, stammer, use a lot of filler sounds and words in our speech which makes it sound like a dull affair. Gweek is an app that helps people to speak better. In terms of operations, it is as simple as it can get. You fire up the app after installation, sign in, give the app the necessary permissions before proceeding with your Gweek calls. For the first call, you get a choice to talk for two

minutes on one of three topics - love, life and work. Once this call is done, you can review your call or upload it for a Gweek score. The score is an analysis of your performance and compares you to the global average. A more detailed report, shows you the particular issues prevalent in your speech. You have to keep taking the first call until you achieve a score greater than 95 at least three times, at which point you would have graduated Si1 and move on to Si2 where you take a video call which analyses your gestures and eye movements

as well. A consistent feature along the levels is the leaderboard which compares you to famous individuals. Our team member scored a 64.2 but was still listed as a better speaker than Angelina Jolie. The feedback for subsequent calls, even if you're not levelling up, is quite encouraging. Two additional levels are listed on the app as Si3 and Si4 but details for the same are not available. We recommend this app for everybody, even if you don't have speech issues, since the valuable insights the app provides are all free!

Stellio Player

Audiophiles looking for a good app to play their high-quality lossless tracks will be happy with Stellio Player. With FLAC support, the app offers crossfade and gapless playback options.

Overdrop

While there's not much to innovate when it comes to reporting the weather around you, Overdrop still managed to get noticed due to the 30+ widgets and great customisability.

Curio

Ever feel like you don't have the time to even read a few articles online in the day? Curio.io brings you a host of articles converted to audio articles, at \$6.99 per month or \$59.99 per year.
