

Redmi Note 6 Pro launched

After its release in China, the Redmi Note 6 Pro has set foot in India, priced at Rs 13,999. <https://dgit.in/dec18-24-1>

eSIM coming in December

After an unfortunate delay, Verizon reportedly will be getting eSIM support by the end of December. <https://dgit.in/dec18-24-2>

Maintain a 16 pixel gap between the sticker art and the canvas.

all your images. WhatsApp has provided a sample PSD file of the same, you can check it out here - <https://dgit.in/WAPSD>.

- All stickers must be in the WebP format. Unfortunately, animated WebP or stickers are not yet supported.
- Each sticker must be less than 100KB in size to ensure your stickers load quickly.
- A tray icon or an identifier is a necessity for each sticker pack. This image must be 96x96 pixels with a maximum size of 50KB.

REDUCING THE PNG SIZE

It is highly recommended to reduce the size of your PNG file to facilitate faster loading times and lesser data consumption. WhatsApp's in-house stickers are about 15KB each which seems to be the optimal size. There are a few methods that have proved successful in reducing the size of these images.

Convert your PNG file to a WebP file and reduce the size while making this transformation. Attempt to set the quality of the image to below 100% until you can get the lowest size without any prominent deterioration of image quality.

You can also utilise a PNG Optimiser or Tool to achieve this end. You can use PNGYU, a simple PNG compression tool, for MAC or Windows by downloading it here - <https://dgit.in/PNGYU>.

CONVERT TO WEBP FILE

To create stickers for WhatsApp, you must convert your PNG images to WebP. This format usually does a stellar job in retaining image quality while reducing the file size which is a preferred state for stickers. You can convert your PNGs to WebP using a few different methods.

- Android Studio enables you to make the conversion from PNG to WebP seamlessly. Simply, create a new project on Android Studio and open your PNG sticker art. Right click on the image and hit convert to WebP. Uncheck the box that says 'Skip images with transparency/alpha channel'.
- You can also install a plugin for Photoshop which allows conversions to WebP. Download it for Windows or MAC here - <https://dgit.in/PSWebP>.
- Additionally, you can also utilize cwebp (<https://dgit.in/cwebp>), which is a command line conversion tool.

Note: While running tests, we found that Android Studio works best to convert the PNGs into webp files. We faced some errors while trying the other methods, however they have worked for a large audience.

CREATE YOUR APP

Get your developer gloves on! We can now get started with constructing the app for your very own sticker pack for WhatsApp. You will need to download Android Studio - <https://dgit.in/AndroidStudio> as well as the Sample

Code zip file - <https://dgit.in/Sample-Code>. Using the Sample Code, you will only need to minimally modify it to create your basic yet functional sticker pack app.

- After downloading the requisite data, you will need to open the entire folder for the sample app in Android Studio.
- Navigate your way through stickers-master/Android/app/src/main/assets in File Explorer.
- You will find a folder named '1' inside the assets folder. Open the folder and replace all the preexisting files with your own sticker files in the WebP format. You will also need to replace sample tray icon PNG file with your own identifier image.
- If you are looking to create more than one sticker pack in your app, simply create additional folders named 2, 3 and so on until your needs are met. However, you can only create a total of ten sticker packs in an app.

MODIFY CONTENTS.JSON

Next, you will need to navigate to the assets folder yet again and modify some of the metadata in the contents.json file with your own. This is necessary since most of this data will show up in the app you create. You certainly do not want the WhatsApp 'cuppy' sticker being part of your sticker pack, do you?

- Name: Replace this field with your own sticker pack name having a maximum of 128 characters.
- Identifier: Name this with '1' since that is the name of the folder with all the stickerpack images.
- Publisher: Add the name of the publisher or creator here (that's you), this also allows a maximum of 128 characters.
- Image file: Replace the current file names with the precise files names of your sticker images containing both name and extension. The order you input the images files in the contents.json file will be the exact order they will appear in the app.

You will need to convert your PNG image to WebP format.
