

Samsung's Infinity O display

Samsung showed off four displays recently, one of which is the Infinity O that punches a hole in the screen.

nasty. In a way, you'd be right to assume that but let me bring up *sigh* Fortnite. Yeah, the bane of the gaming world, the extremely popular title that's omnipresent across all known platforms bears all of these characteristics. So yeah, if the game is really popular, the hardware supporting it can get popular too and the same can

be said for the upcoming VR HMDs such as the Oculus Quest. So now, I've got to figure out if I'm going to ditch the HTC Vive that I own and get a Quest next year or should I wait longer. The Vive is quite powerful and can render much higher-poly games so I'm thinking that I'll stick with the Vive and get myself a Quest. 

BUYING ADVICE

PC FOR SOFTWARE DEV

Q Hi, I am a consistent follower of digit from last 8 years since I was in school. I have been really thankful to digit for the tech updates you guys provide. Great job you guys are doing I must say. Keep up the good work.

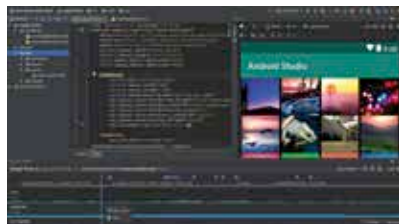

I am an IT Professional and from last couple of months I was thinking to shift from my laptop (6 years old) to a desktop for my job say it be learning new programming skills like Android development (using Android Studio), web development (Brackets, Notepad++, Sublime text editor), Java (using Netbeans, eclipse), PL/SQL Programming, some advance level photo-editing tasks and other basic IT-skills. All this I need to run on a Linux OS like currently, I am using ubuntu18.04LTS. I have been seeing a column in digit where it has been mentioned about the PC configs that one may use for the given purpose but it is mainly gaming oriented. Can you please help me assemble a PC (Desktop) that can suit my needs the best, keeping in mind the budget constraint to be minimal.

Thanks In Advance

—Kaushal Manna

A Hey Kaushal,
With most of these IDEs, it is best to go with a CPU that has plenty of L2 cache and supports virtualisation instruction sets. Both, AMD and Intel CPUs have virtualisation technologies in the form of AMD-V and Intel-VT which work wonders when you want to use emulators or virtual machines to test out some of your

programs. Also, your motherboard's BIOS should have the option of enabling these virtualisation features. Aside from that, go for a bare-minimum of 8GB of RAM or 16GB if budget permits. The graphics card for an AMD machine would be just a token device to get your display running. There are CPUs such as the Ryzen 3 2400G and 2200G which have built-in GPUs but it's better if you go for the Ryzen 5 or Intel Core i5 CPUs. Then there's the monitor. Some developers like to see the entire line of code in one line and have another window open on the side to run a few builds in rapid iterations. Going for a QHD monitor might be optimal but

IDEs come with their own requirements

they tend to be a bit expensive. Or you could always go for a 2x FHD monitor setup for slightly lesser. Here's an AMD based PC configuration. For an Intel-based system, just pick a Core i5-8400 or better. They're kinda expensive at the moment because of low market stock, so the AMD configuration is cheaper as you've requested.

- CPU: Ryzen 5 2600
- Motherboard: ASUS PRIME-B450M-K
- RAM: G.Skill F4-3000C16D-16G1SB 16GB 3000MHz
- HDD: Toshiba 1TB DT01ACA100
- SMPS: Cooler Master MWE 450
- Graphics Card: GT 710
- Monitor: BenQ GW2480 24-inch IPS
- Cabinet: Any OEM
