

colours of the title elements, to match your content or your channel. You can even layer titles one on top of the other. You have to pick the colour from a colour wheel, and unfortunately you cannot specify the exact hex values at this point of time. However, once you have selected a colour, a plus icon on the top right corner allows you to add the colour to the 'My Libraries' tab. Doing this allows you to consistently pick the same colours for titles across multiple videos, or different titles within the same video. You can layer on multiple titles one on top of the other. The themes tab

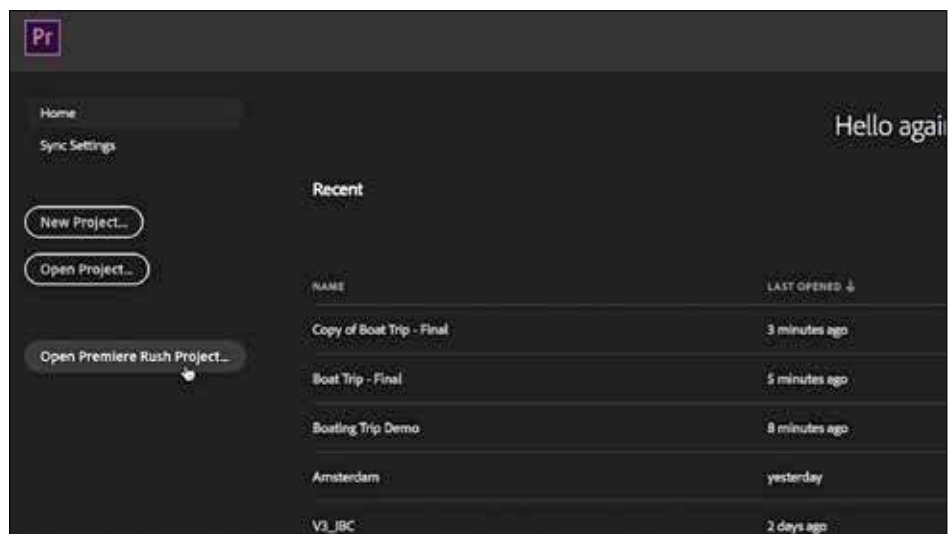

Adding and customising titles

has an exhaustive choice of palettes that go well with each other.

EDIT A LAYER WITHOUT DISTRACTIONS

For a complicated project, you might want to continue editing a particular layer, without all the other assets coming in the way of visibility. You might also want to work with an audio layer without hearing another audio layer. It is possible to do this by tapping on the second icon from the right. Tapping

Importing the Rush project in Premiere Pro

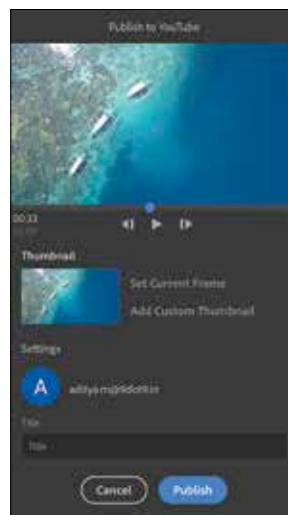

on the sound button allows you to mute the voice. This shows an advanced timeline, where you can tap on the eye icon to hide some layers that you do not want.

EXPORTING TO SOCIAL MEDIA

Rush also allows you to directly export videos to social networks. The supported platforms are YouTube, Facebook, Instagram and Behance. On the top right corner of the screen is a box with an upward pointing arrow, which is the export button. The video has to be rendered before it is exported. At the time of rendering, you can select the quality options, which is resolution and framerate. On rendering, the video is automatically saved to the Camera Roll, and the four social networks show up below the video. Tap on the network that you want to export to, and sign in with your credentials. At this point, platform specific options will appear. When uploading to YouTube for example, there will be options for the title, the description, tags, privacy settings and category. You can also schedule the post if you want to.

USING A CUSTOM THUMBNAIL

For the thumbnail, instead of the default first frame of the video as picked by Rush, you might want to set in the title of the video, or a custom image that is not a frame in the video at all. To select another frame from the video, simply drag the slider of the video on top of the screen.

Choosing a thumbnail to your project

The frame at which you set it to, will be selected as the thumbnail for the video. You can also tap on 'Add Custom Thumbnail'. This lets you pick another picture from the Camera Roll, your Creative

Cloud, or even your Dropbox account. Tapping on 'Set Current Frame' will revert to a particular frame from the video. Fill out all the other platform specific options, and hit Publish.

EDIT VIDEOS IN PREMIERE PRO

Premiere Pro has more advanced capabilities than Premiere Rush, and it is possible to easily import a Premiere Rush project into Premiere Pro, and continue working on it. If you have an Adobe CC account that includes Premiere Pro, then you get to use Premiere Rush as well. When you open Premiere Rush on the mobile device, there is an option on the bottom left corner to sync the project with Premiere Pro. The option is selected by default, and this is necessary to open the project in Premiere Pro. Once you start up Premiere Pro (only 2019), there below 'New Project' and 'Open Project', there will be an option saying 'Open Premiere Rush Project'. When selected, all the synced Premiere Rush projects will show up. Select the project you want to edit from this list, and you're good to go.
