Building an app without coding

A zero LoC guide to making your own app

Arnab Mukherjee | arnab@digit.in

S

ay what you may, the age of apps is far from being over. For most things today we turn to our smartphones, and on our smartphones, we turn to our trusty apps. In such situations, wanting to build an app is a very

valid and fruitful desire. You could possibly want one to augment the impact of your business, manage a restaurant and accept orders, or even just try your hand at building an application for its own sake. However, there seems to be one major requirement that you need to satisfy to build an app that can accomplish any of that - coding. Or wait, is there?

Turns out, there are apps to build apps out there! Talk about enhanced convenience. Multiple platforms allow a little to no-coding approach to building your app and even provide you with ample in the seemingly-taxing process. While most such platforms charge a fee for their offerings, there are ones that sport free tiers or trial periods as well. From a basic, no-nonsense information app that does out predetermined information, to a full-fledged restaurant app, such platforms are capable of building either and additionally, anything in between. We show you how to do it with Appy Pie's free tier.

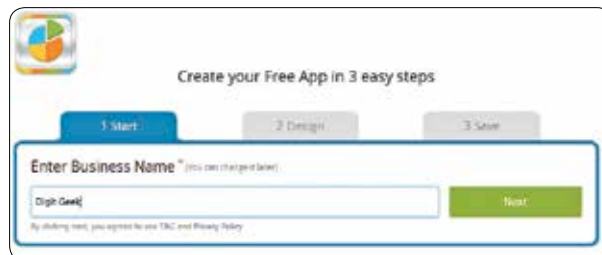

WHY APPY PIE'S FREE TIER

For this workshop, we first worked on picking a particular platform. Multiple platforms come with their own advantages and disadvantages. For instance, GoodBarber is more focused on making an app look good, with its visual templates allowing you to choose from tried and tested app designs. However, their restriction of a one month free trial with no other free tier available makes them a bad choice if you want to build a barebones app for the long term without investing money. On the other hand, the exact same requirement makes Appy Pie a better choice because of their free tier that comes with its own set of restrictions. For instance, you can only edit your app for 48 hours since its creation. You'll also not get any help towards publishing your app on app stores. Additional paid layers get you things like analytics, monetisation through ads, push noti-

fications and more. You can even build an app for multiple platforms like iOS, Android, Windows and more. However, for simplicity's sake, we will only concern ourselves with the free version for a basic Android app building workshop without writing a single line of code.

STEP 1 GO TO APPY PIE'S WEBSITE

Go to appypie.com and hit "Get Started". Enter the name of your Business here. For us, that would be "Digit Geek". The preview on the right gets updated constantly with the changes you do on the left. The moment you hit Next, the platform analyses the name and comes up with suggestions for category. Since we're trying to build an app for our website, we went with 'Information'. Hit next.

STEP 2 PICK THE LAYOUT

Think it's too early to finalise a layout? That's because you aren't finalising one. You can edit the layout later, but at this stage this selection is essential to provide a base for the modules that will be added in subsequent stages. Picking a particular layout updates the preview on the right.
