

Tumblr back on App Store

Following Tumblr banning all adult content, the app has returned to grace the App Store once again. <https://dgit.in/jan19-17>

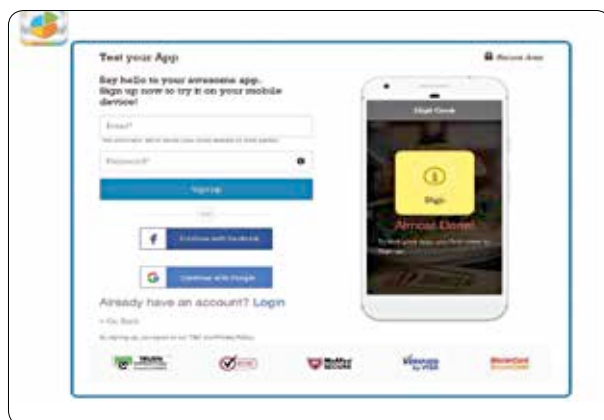

Microsoft Hummingbird

An AI-based news aggregation app that personalises the news feed according to the users' preferences. <https://dgit.in/jan19-18>

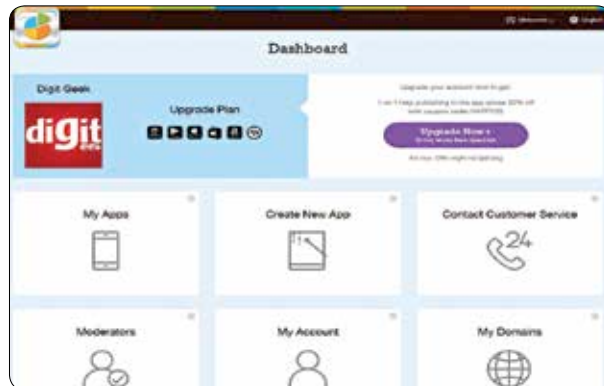

STEP 3 LOGIN

You need to log in to go further. You can create a new account with your email ID, or use your existing Facebook or Google account to sign in. Enter the details and hit 'Continue'.

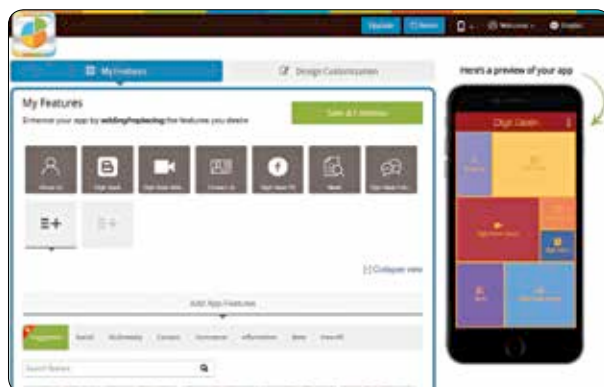

STEP 4 YOUR APP IS READY? NOT REALLY

At this stage, the page will show you that your app is ready to be tested. This is essentially a basic visual skeleton of the app. Click on the Appy Pie icon to go to your dashboard. From here, go to My Apps>Manage and Edit.

STEP 5 THE ACTUAL APP BUILDING

The screen where you land now is where most of the action happens in Appy Pie. This is where you

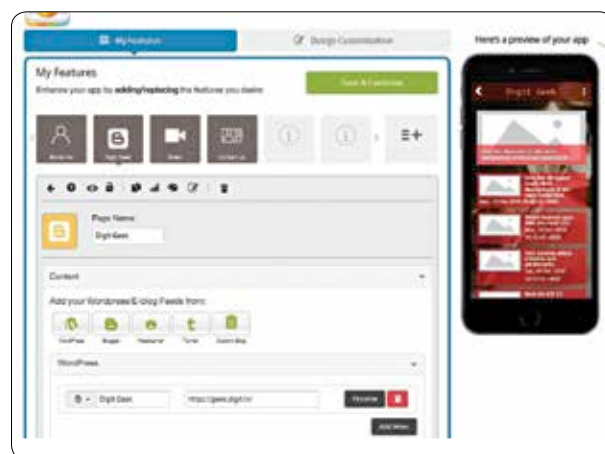

will add individual features to your app and define what they will really do. Let us take the example of the blog feature.

STEP 6 ADDING A FEATURE

Clicking on the Blog add-on will add it to your features with the default inputs already fed in. Click on the added feature under 'My Features' to edit it.

Here, you pick the desired blog platform and enter the URL of the blog for the platform to automatically pull links from. You can pick the desired layout for this section from the colour scheme tab.

In a similar fashion, you can add multiple features like a Facebook Page, an About Us page, and more with interactive contact information. You can add a video section in the app where adding the URL of a YouTube channel lists all of its videos and can be viewed within the app itself!

STEP 7 TEST YOUR APP

Now it is time to test the app that you've built so far. To do that, hit 'Save and Continue', which should lead you to the conclusion page. This is where the platform will prompt you to go to My Apps. Even if you choose not to do that, the original dashboard has a 'Test App' section that points you to a QR code and a URL where you will be prompted to download the APK for your app. To install this APK, you will need to enable installation from Unknown sources. Once installed, just fire it up and play around to check the functionalities.

STEP 8 FINE TUNE YOUR APP

During testing, you might find things you need to change. For instance, you might want to add a new piece of contact information into the Contact Us page. After making such changes on the Appy Pie platform, hit Save and Continue. This updates your app.

All you need to do to experience the change is restart the app itself. Keep fine-tuning the app until its performance is exactly what you were aiming for. Remember, you only have 48 hours to get the app you want.
