

Nubia gaming phone in India

The Nubia Red Magic gaming phone has made its way to India with RGB lighting, GameBoost button and Snapdragon 835. <https://digit.in/jan19-31>

Razer peripherals announced

Razer revealed its latest wireless mouse and keyboard set named Razer Turret which is designed to work with the Xbox One. <https://digit.in/jan19-32>

Audeze Mobius

A game changer

G

aming headsets normally make the use of dynamic drivers to deliver the audio.

The Audeze Mobius uses planar-magnetic drivers that are quite common in audiophile-grade headphones. So, this is the first time they are entering the realm of gaming headsets. Naturally, the audio quality gets a massive level up in several aspects. It'll not only take care of your gaming audio requirements, but you will also get to enjoy superior performance while listening to music and watching movies.

Build quality and design

Build quality on the Mobius is top-notch as there's no sign of weakness on the headband or the earcups. We found the clamping force to be slightly higher than average after wearing it for some time. However, the cushioning on the memory foam earcups are comfortable enough to keep them on for a couple of hours.

The left earcup has many hardware buttons for control over various settings. You can adjust the volume levels of both the drivers and microphone audio using the separate dials present on the left earcup. A single, double and long press on these dials have different functions such as changing tracks, switching sound profiles, turning off USB charging, etc. You will find the 3D audio mode button which can be toggled between three modes. Pressing the button once will recalibrate and set the default position of the audio source right in front of you, based on your head's current position and orientation. Long pressing the button will toggle between the different modes. The first one is auto where the audio source is stationary. The next mode keeps the audio source relative to your head's position to avoid situations

where if you completely turned around, it accordingly compensates rather than keeping the audio source stationary based on the original setting. The third mode switches off the 3D audio localisation feature and the audio becomes normal stereo sound. It also has a

port for the microphone, USB Type-C connector to connect to your PC or laptop and it also doubles up as the charging port.

Head tracking has been brilliantly implemented on the Mobius that outputs really good 3D sound localisation to make the audio source stationary. No matter how much you move or tilt your head, the audio source's position will remain constant. The detachable mic cancels out almost all the ambient noise and captures crisp audio. All the controls are present on the headset and you don't really have to use the provided software. If you wish to see how the headset is tracking your head or whether the position of your head is accurate, then the software does a good job of visualising it in real-time.

Performance

gaming, you're going to have a great time in FPS and RPG games, espe-

cially the ones with a lot of action. Whether you hear gunshots or explosions, the reverberation could be felt without being too overwhelming. The sound signature is more towards the warmer side. In multiplayer games, a good quality microphone will allow the player to communicate with his teammates without any disturbance. Noise cancellation is a little too good on the Mobius' detachable mic and ends up feeling too quiet. However, that's a personal preference. Voice quality was crisp and it didn't sound too shrill. Although a pop filter would have been great over the mic. Overall, we had a satisfying experience while gaming. The same was the case for music. With Bluetooth support, it can be connected to any supported device. This is another feature that makes it a good choice as your primary audio device.

Although we were expecting good performance in gaming and music, we were blown away with the surround sound audio performance in movies. It didn't create the same soundstage as a movie theatre, obviously, but it was superior to what we've experienced on other headsets. Movies with amazing background scores and fantastic chase sequences with a lot of action will definitely be a treat to listen to on the Mobius.

Verdict

The Audeze Mobius manages to deliver the best a gaming headset could offer. Right from the build quality to audio performance, we didn't find the headset lack anything. However, all the amazing features and performance don't come cheap. If you have money to spend, you won't be disappointed with this purchase at all.
