Dell Inspiron 7572

With solid build comes solid weight

While configuring their new Dell Inspiron 7572, a buyer has the option to pick from extras like a Microsoft Office 2019 licence, an extended subscription to McAfee Multi-Device Security, and other digitally delivered software. All this points to a pretty positive beginning for the Inspiron 7572.

Build and Design

The exterior looks classy and is grippy to hold. The base contains neat silver-finished screws for the cover, grilles for the two speakers, heat vents, and a debossed Inspiron badge.

The lid is too tight to be opened with the push of a single finger. However when it's opened the display rests firmly in position even when the laptop is shaken about. Sadly, it refuses to be pushed back beyond 145 degrees. There's absolutely no sign of flex on the lid or the keyboard.

The web camera sits below the display and the Dell logo, very close to the hinge in fact, like in the Dell XPS 13. The area around the keyboard has a nice, soft feeling to it. The lower edge of the laptop base is very sharp and it makes typing practically impossible. All things considered, the build and design are pretty good.

Display, Audio, and IO

The Full HD IPS LCD panel on the 15.6-inch display is bright enough for most conference rooms but not so much for sunny balconies. The display's surface is quite reflective, which makes viewing at certain angles a bother at times. The display on the Inspiron 7572 is good enough for a lot of dinnertime video-watching but not so much for image-editing.

The two down-firing speakers on the Dell Inspiron 7572 are loud enough

for a quiet bedroom of say, 25x25 feet. Vocals and instruments can be heard sharply but bass is limited. The Dell Inspiron 7572 comes with a big set of traditional ports. However, there's no USB Type-Cs to be found.

Keyboard and Touchpad

The keys have enough travel and resistance but could have gone deeper, especially considering the laptop's thickness.

7572 is a large and comfortable one. Clicks aren't very tactile but aren't difficult either.

Performance

The Inspiron 7572 scored decently on our benchmark tests. While it scored above the similarly priced Lenovo IdeaPad, which also features an 8th-gen Core i5 CPU and an MX 150 GPU (but with 2GB of VRAM), in processor benchmarks like PCMark 8's Accelerated Creative test, it failed to beat it in video-rendering benchmarks like 3DMark's Sky Diver. In everyday use case scenarios the Inspiron performed well. With over twenty-five tabs open on Chrome and multiple app installations happening, the Inspiron held up with no lag or stutters. Heat, sadly is not very well managed.

The two-stage backlighting provides ample light in the dark. Given the amount of space available on this 15.6-inch machine, Dell could have thrown in the number pad as well. The matte-finished touchpad on the Inspiron

Gaming on the Inspiron 7572 was a disappointing experience. Doom on Ultra graphics settings in Full HD resolution gives a single-digit frame rate. At no point did the frame rate cross 30 frames per second on Doom. Metro: Last Light in Low graphics settings was better at an average of 40 frames per second when there wasn't too much action on the screen. On the whole, performance on the Dell Inspiron 7572 is good.

Battery

On our battery benchmark test, the Inspiron 7572's battery scored about 4 hours, which is not too shabby. It's ten minutes behind the Microsoft Surface Laptop. In reality the Inspiron 7572's battery dropped from full to 80 percent in a little less than 45 minutes. On an average it lasted between 4 and 5 hours with the screen brightness turned up to 75 percent, the Wi-Fi enabled, and Bluetooth disabled. Charging happened from near zero to full in almost exactly two hours, which isn't bad at all.

Bottom line

The Dell Inspiron 7572 promises a lot and delivers most of it. If you're looking for performance, great build, a clean look, and decent battery life, while getting access to everyday ports like HDMI and USB-A ports, then consider the Inspiron 7572. The Dell Inspiron 7572 a great machine for movie-watching and some photo-editing. But if you're looking for portability, lightness, and a USB-C port while getting similar performance, look towards the Lenovo IdeaPad 530S. If you're looking to play video games seriously, then consider the Dell G3.
