

Twitter reignites war

Twitter has reignited the age-old Android vs iOS war with a new feature that shows which device a tweet came from. <https://dgit.in/jan19-43>

HuaweiPay

UnionPay cardholders in Russia will now be able to use Huawei's new mobile payment option - HuaweiPay. <https://dgit.in/jan19-44>

X than Windows. But if you'd like an "all in one" approach like WAMP, with a nice clean and easy to use interface, then we'd strongly recommend MAMP.

grunt connect

Grunt at its essence is a JavaScript based task runner and allows you to automate tedious time consuming tasks. We use it in Phaser to build our distribution scripts for example. But it can also be configured with the plugin Connect to serve local files, acting as a web server.

Simple HTTP Server with Python

If you need a quick web server running and you don't want to mess around with setting up Apache or downloading an app, then Python can help. Python comes with a simple built-in HTTP server, which can serve files from any local folder. Naturally the only thing you need to have installed is Python.

http-server for node.js

http-server is a simple, zero-configuration command-line http server for node.js. It is simple and hackable enough to be used for testing, local development and learning.

php 5 built-in web server

PHP 5.4.0 provides a built-in web server. It's only really suitable for development purposes and serves all files sequentially, but is easily powerful enough for testing HTML5 games. It's invoked from a single command-line call.

CHOOSING AN EDITOR

Next, we will need an editor to prepare the JavaScript code. There are many available, each with their own strengths and weaknesses. If you're a developer you will probably swear by your own preferred editor. Otherwise here are some options for you:

Sublime Text

This is the editor the Phaser team use for building the framework and all projects. It's even the editor this guide

is being written in. Sublime should be considered as an extremely powerful text editor rather than an IDE.

Atom

Atom is a free cross-platform text editor from the team at GitHub. A tool you can customize to do anything but also use productively without ever touching a config file.

Visual Studio Code

Visual Studio Code is a popular and powerful editor which runs on your desktop and is available for Windows, macOS and Linux. It comes with built-in support for JavaScript, TypeScript and Node.js and has a rich ecosystem of extensions for other languages (such as C++, C#, Java, Python, PHP, Go).

DOWNLOADING PHASER

The next phase (pun intended) is to download Phaser. It is an open source project and available to download for free. There are no fees regardless if the use is for a commercial or free project.

We use github to manage the project and you have various options on how to download it.

Git: <https://github.com/photonstorm/phaser/tree/v3.15.1>

Npm: `npm install phaser@3.15.1`
CDN: Include the code at <https://dgit.in/PH1>. Yes. Github provides the option to download the whole repository as a zip or tar file. However learning to use git will be a great boost for managing versions of it. And if later you think you can improve the code for Phaser it makes doing so much easier. So lets

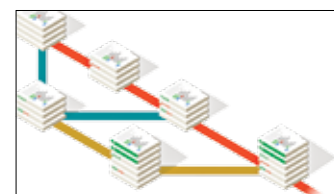

*CODING MATTERS

*TigerGraph releases cloud version

TigerGraph Cloud supports AI and machine learning applications, and was announced at the annual Amazon Web Services Re:Invent conference..

<https://dgit.in/TGCloud>

*Git improves usability

Git 2.20 has been released with improvements to cloning, fetching, and grepping, all designed to improve usability and performance..

<https://dgit.in/BetterGit>

*Salesforce announces JavaScript framework

The Lightning Web Components Framework is aimed at JavaScript developers who want to use Salesforce's services..
