

Hublot Big Bang Ferrari Scuderia Corsa

F

ew things speak luxury and tech together as well as limited edition timepieces. Six years ago, Swiss luxury watchmaker Hublot announced a partnership with Italian sports car company Ferrari and their racing arm Scuderia Corsa. Since then, the racing team has racked up its 100th victory and it is to celebrate this milestone that the watchmaker has revealed an ultra limited edition timepiece with the Hublot Big Bang Ferrari Scuderia Corsa. With just 25 pieces that will ever be made, the watch uses the best Ferrari inspired material to become worthy of this milestone.

For instance, carbon fibre from the Ferrari Scuderia Corsa's GT3 racing machine has been used for the 45-mm diameter case. The carbon and ceramic bezel resembles the disk brake on the wheels while the H-shaped that hold it to the case are made of black PVD-coated titanium. The screw-down winding crown combines black PVD titanium with black and red composite resin, and the red calfskin leather strap is lined with black rubber. The watch face is protected by a non-reflective sapphire crystal cover. The hands and hour markings are both covered in red lacquer and are housed over a sapphire dial that also comes with a Ferrari logo. The Unico HUB1243 movement from Hublot is visible through the dial and comes with a flyback chronograph function driven by a column wheel. There's also a speedometer type date display near at 3'o clock and a subdial 60-minute chronograph counter around it. Made up of 330 components, including 38 jewels, the Unico movement beats at a frequency of 4 Hz and stores a power reserve of 72 hours.

Star Wars Galactic Empire DSA Keycap Set

O

ne doesn't think of keyboards immediately in the context of collectibles, but with stuff like the official Star Wars Galactic Empire DSA Keycap set from NovelKeys, that could easily change. While modders and custom keycap makers have been building such stuff for a while, this is the first keycap set officially licensed with Disney. The DSA Galactic Empire pays an ode to the peak of Palpatine's empire with Imperial symbols and Aurebesh letters.

For those unfamiliar with the name, Aurebesh is a writing system in the Star Wars universe used to transcribe Galactic Basic, one of the most used languages in the galaxy. You get to pick between two keycap sets – one with full Aurebesh legends, meant only for the most hardcore fans, and another with English subheads alongside Aurebesh legends, for those who're not that strong in Galactic Basic. DSA Galactic Empire uses a uniform profile that fits on Cherry MX-mount switches (Kailh, Gateron, Cherry MX, and more).

XTAL

O

n one side, players in the VR arena are trying to see how the segment grows to mature, and they're doing that by pricing their products and offerings at more affordable numbers. On the other hand, the rebels in the industry are trying whatever they can to make VR reliable, useful and high performance for a change. XTAL by VRgineers, a VR startup, is a \$5,800 piece of technology that promises to prove that VR is not a gimmick. If the specifications on the headset are anything to go by, things do look promising. For starters, the headset

features dual QHD OLED displays (2560x1440) enabling a 180-degree field of view. Most VR headsets suffer from blurring around the edges. By increasing the field of view to 180 degrees, XTAL can deal with this issue by relegating the blurred parts to the often

ignored corners of your vision. Leap Motion sensors are integrated into the device so hand tracking is part of the mix along with integrated eye tracking. The VR headset itself is a standalone unit. While the XTAL isn't brand new, what we're talking about is an upgraded version, especially when it comes to the lenses. Along with the expanded field of view, you also get a 50% larger 'super focussed' area increasing the detail. The bigger eye box allows for AutoEye, a system where the lenses adjust themselves to accommodate for every user's interpupillary distance, to perform better by 20%. The headset will be demonstrated at CES 2019 as well.
