

DOES THIS SECTION EVEN NEED AN INTRODUCTION? FROM COMPUTERS TO MOBILES, AND HEADPHONES TO GPUs, IT'S ALL HERE...

THIS MONTH IN TECH: CES - The world's biggest consumer technology show happened, read our recap of the biggest happenings at CES. Understand the innovations behind your smartphone camera and take a look at how startups are handling the recruitment crisis in the country.

Apple might drop LCD for OLED

A recent WSJ report indicates that Apple may discontinue using LCD technology in their upcoming 2020 lineup of iPhones in favour of OLED technology. Use of OLED will help Apple build slimmer phones with curved edges.

WHAT'S NEW

Amazon's Rekognition can't recognise

After the much discussed goof-up wherein Rekognition falsely matched 28 US lawmakers with mugshots, this new report from MIT's Media Lab spells even bad news for the upcoming service. From tests done at the MIT Media Lab which included similar facial recognition software made by Microsoft, IBM, Face++ and Kairos, it was found that Amazon's Rekognition made absolutely no errors while identifying light-skinned men but when it came to women, it made mistakes about 7 percent of the time. With dark-skinned women the accuracy rate dropped much further and Rekognition misidentified dark-skinned women as men about 31 percent of time. The overall rate of misidenti-

cation was 19 percent. Amazon did respond to MIT's study and ran a similar test with the up-to-date version of Rekognition on a similar set of images numbering in the millions and found zero false positive matches.

Mark Zuckerberg wants to unify WhatsApp, Instagram and Messenger

The New York Times reported that Mark Zuckerberg is planning on unifying the underlying messaging systems of WhatsApp, Instagram and Facebook Messenger. Facebook is also working on adding end-to-end encryption across the remaining services which don't have them at the moment. WhatsApp incorporated end-to-end encryption a few years back

while the other two don't have it enabled or present at all. After the unification, the services will continue to remain as stand-alone apps. This unification

comes across as a move to fight the growing fragmentation among messaging services and the loss of users to other platforms such as Telegram. Another aspect of this unification is that it will become more difficult for regulatory bodies to break up Facebook from the other two services should there be an antitrust lawsuit.

Custom TV sizes thanks to MicroLED

MicroLED, a TV technology that was recently showcased at CES 2019 by Samsung uses emissive LEDs eliminating the need for backlighting. This allows for modularity and thus allows manufacturers to build custom TV sizes for customers.
