LG Signature OLED TV R

A TV has always been an imposing device in your living room and over the years, it has only grown in size making its presence even larger. Unless of course, it's an LG Signature OLED TV R. Utilising a massive rollable panel, LG makes the TV disappear when-

ever you want it to into nothingness. All that remains is the stand, which itself is quite the looker. It's even got something called the "Line Mode" wherein the panel peeks from the stand by about half a foot and can be used to display the weather, notifications or just add to the overall ambiance of the room.

Samsung's 75-inch MicroLED TV

Samsung returned with their MicroLED TV this year, except in a much smaller size. Something that would fit on your wall rather than becoming "The Wall". It showcased a 75-inch 4K TV which uses millions of tiny LEDs which are all emissive i.e. they don't need their own backlight. Moreover, these supposedly can deliver OLED quality visuals without all the downfalls of OLED technology such as degradation over time. The price remains unknown for now.

Bell Nexus

Bell unveiled the NEXUS, a hybrid vertical take-off and landing air-taxi at CES 2019. It's powered by a hybrid electric propulsion system and has six tilting ducted fans to help it soar into the skies. The NEXUS was made possible by the combined efforts of Bell (VTOL), EPS (batteries), Thales (flight control computer), Moog (actuation), Safran (propulsion) and Garmin (avionics computer).

HTC Vive Pro Eye

Most of the details of the HTC Vive Pro Eye are shrouded in mystery. We know that it has eye tracking to enable foveated rendering, can work wirelessly and is focused on a more broader audience. The eye tracking also serves as an input which can add a whole new dimension to the possibilities within a VR system. This is one thing we're very excited to hear more of.
