

GAMING AT CES

Razer Raptor

CES is where Razer brings out the next big thing they've been secretly working on. This year, they unveiled the Razer Raptor, a 27-inch IPS monitor running at a resolution of 2560x1440 pixels. The Razer Raptor also has motion blur reduction and has a response time of 1 millisecond. We don't know if that's with the overdrive technology turned on or off, but we can safely assume that it is switched on. The panel can go up to 144 Hz on the refresh rate with support for FreeSync. And the colours? 95% DCI-P3 and HDR400 support. You can say that Razer has got the

internal hardware right but that's not all, the monitor is a treat to look at as well. It's got ultra-thin bezels on three sides, a matte black texture all over and the panel tilts up to the point that you can easily switch the cables out. Speaking of the cables, there are cable management grooves machined into the stand along the backside so you retain a very clean desk and the cables are nowhere to be seen. As for connectivity, it's got HDMI 2.0a, DP, USB-C, 2x USB3.1 gen1, DP (via USB-C) and a Headphone Jack.

PRICE - \$699

Telasuit

The next level of immersion isn't about just donning a VR headset and flailing your hands in the air. To achieve full body tactile feedback, you need to simulate nerves all over the body and that's where the Telasuit comes into the picture. It's the stuff of science fiction with its futuristic looks, the entire body suit has multiple elements to provide haptic feedback based on what your in-game avatar experiences. Got shot in the gut, you'll feel it. Got an arrow to the knee, you'll feel that as well.

Acer

Acer unveiled the Predator Triton 900 at CES 2019. Like the Triton 700 before it, the Triton 900 has a slim form factor. It's a 17-inch gaming convertible laptop with a 4K screen that flips to come closer to the user. It can also be flipped into a tablet, one that sports an Intel 8th Gen processor and the latest NVIDIA GeForce RTX 2080 mobile graphics card. This configuration was teased at IFA 2018. It also has multiple PCIe SSDs in RAID 0 for some ridiculous transfer speeds.

ROG Mothership

If you liked how Acer pulled off the new design, then you'll love the ASUS ROG Mothership, with a stance aimed at cooling. Enconced in a CNC-machined all-aluminium shell, the ROG Mothership packs a 17.3-inch 144 Hz G-Sync display along with an Intel Core i9 processor and the latest 20-series chip from NVIDIA. The ROG Mothership brings portability to what can be termed as near-desktop configuration and has detachable elements that set it apart from the Acer Predator Triton 900.

MSI GS75 STEALTH

The gaming laptops took centre stage for MSI at CES, and the MSI GS75 STEALTH was the showstopper. This laptop takes things up a notch with the new NVIDIA GTX 2080 mobility GPU. Aside from the latest Turing-based GPU, another facet that stands out with the GS75 STEALTH is the massive 17-inch 144 Hz display. It even gets three NVMe SSDs which can be put in a RAID configuration. According to MSI, the GS75 STEALTH can provide up to 8 hours of battery life.
