This wooden wifi porter that lets mobile users to connect to Wi-Fi network with a simple tap. <https://digit.in/feb19-67>

**Food delivery robots**

European startup is providing six-wheeled delivery bots to George Mason University for food delivery to students. <https://digit.in/feb19-68>

G

etting a job becomes a priority in most of our lives at some point or the other. When it does,

unless you're really lucky, the recruitment process' ugly face rears its head every single time. It is not so different for companies looking to hire the right candidate either.

A job applicant needs to worry about applying for the right jobs, getting through the initial rounds of interview, getting picked from an ever-growing pool of prospective candidates and more. According to Glassdoor for Recruiters, a typical corporate job opening receives 250 resumes, out of which 4 to 6 are shortlisted and one is hired. When it takes roughly 6 seconds for recruiters to reject a resume, it's pretty evident that candidates have it rough.

On the other hand, a company needs to worry about shortlisting the right people, making sure they do not hire people with dubious backgrounds, providing a good recruitment experience to all applicants without increasing the cost. The cost per recruitment is increasing over the years, and companies have to maintain a presence on social media, a particularly preferred platform for millennials to look for jobs.

Due to these factors, both the candidate and the recruiter today either dread the recruitment process or do not benefit from it as well as they potentially could. Startups in the recruitment industry are helping both companies and candidates have a more comfortable and seamless recruitment experience by attacking various aspects of the overall problem. We spoke to some of the most notable recruitment industry startups in India to understand how they're doing it.

SCREENING THROUGH BOTS - IMPRESS.AI

There's a prevalent fear that automation of any kind will eventually take away jobs from humans. After understanding impress.ai and its offerings, it is evident that if anything, automation will allow humans to perform their jobs better.

Based out of Singapore, Impress.ai describes itself as an 'AI powered recruiting solution'. "The current recruitment process is costly and inefficient", says Vaisagh Viswanathan, CTO/Co-founder at impress.ai, "When recruiters spend up to 20% of the recruitment cycle just sifting through information, arbitrary filters creep in to help them speed up their work - for instance, a particular CGPA level, a specific set of schools etc. impress.ai aims to automate as much of the data stage as possible so that candidates have a fair, skill-based chance at getting the job."

The arbitrary filters that Vaisagh speaks of are responsible for the quick rejection that a lot of deserving candidates face at the hands of overbur-

dened recruiters. According to Vaisagh, the impress.ai platform attacks this problem on four fronts. The first is a chatbot that takes screening interviews. That chatbot takes into account the qualifications you've mentioned and screens your application with questions based on the same. The second is a bot creation wizard on the recruiter end takes your job requirements and creates a customised screening bot. The third is a semi-automated

scoring system which is partially aided by AI. The screening bot learns from how actual recruiters rate free text answers and even learns how to answer questions from candidates. This allows recruitment professionals to speed through the scoring stage with better data in their hands. The fourth aspect is a reporting system that brings all of this data at the fingertips of the recruiter to be used during an in-person interview.

"We've brought down the time spent by recruiters on information gathering by 75%," Vaisagh says, "Where a recruiter would have to spend 37 minutes to screen a candidate earlier, it now only takes eight minutes. As a result, a candidate, who would usually have to wait a week after application for any progress, now gets an update in 30 minutes."

Last year, Amazon's machine learning experts discovered that their AI recruitment tool was biased against women because it was trained on biased data. It penalised resumes with the words 'women's' such as Women's chess club captain etc. According to Vaisagh, such biases are actively avoided on impress.ai by masking
