However, Mac owners will still need the Office 365 subscription to be able to use certain products. <https://digit.in/feb19-74>

The last trend that we noticed was that of all major TV manufacturers coming up with commercial 8K TVs. This would be the second year that some of these manufacturers have showcased their 8K TVs, but with 4K having become mainstream and gained acceptance worldwide, it's only natural to step things up to the next level. The world's first 4K TV was announced in

2013 and it took about six years before it became mainstream. Content was the slowest to catch up and the adoption of 4K only sped up after that had happened. With 8K, things will be a bit quicker. The first satellite broadcasts in 8K started late last year in Japan and movie cameras capable of recording in 8K have been out for a while. There aren't that many software which

support editing 8K footage but that's not going to take long. We should see 8K achieve mainstream acceptance in about 3 years or so. The day we have a decent media streaming player capable of handling 8K content stutter-free will be when I get an 8K TV. So I have about three and a half years to get super-rich. Anyone got any decent startup ideas? You know where to hit me up. [4](#)

BUYING ADVICE

GRAPHICS CARD FOR 4K PLAYBACK

Q Hey there, would you tell me the names of the graphics cards that can run 4k video smoothly. Asking regarding video editing and playback purposes. Can GeForce 1050 Ti do the job?

—Abhishek Solanki

Zotac GeForce GTX 1050 Ti

A Hey Abhishek, The choice of hardware is always dictated by the software you wish to use to perform your video editing. So if you're using Adobe Premiere Pro, you should check their Qualified Vendor List for all the supported graphics cards capable of accelerating your workflow. Playback isn't as intensive as it used to be. Integrated graphics on Intel and AMD processors have dedicated features that enable smooth 4K playback, so on the newer CPUs, playback isn't a concern. Then there's the question of your workflow and the kind of assets and effects you will be using. GPU acceleration is relegated to handling the special effects

that you add to your video. So if your video is simply about cutting the footage down to size and adding transitions, then a GPU will not help much. You should ideally focus on getting a CPU with more cores and having a token graphics card such as the GTX 1050 Ti or better for when you need to add effects.

GOTTA HAVE AN ODD

Q Hi Agent001, I've been reading your section for quite some time now and I really like it. I want a mechanical gaming keyboard with customizable RGB of good quality strictly under 2000. I already know I'm asking for too much. And I couldn't find such a deal myself so I had to ask you. I have an old rig and I might buy a gaming laptop or a console in a few months (or maybe upgrade my existing rig) so I'm not looking into investing more than that on a keyboard. But if such a deal (mechanical + good quality + customizable RGB) is not available under 2000 I'm ready to compromise on the RGB for non customizable LEDs etc. Or if you suggest a very very good quality mechanical gaming keyboard.. I'm ready to go with no lights at all. I'm also cool if you say that the keyboard is not mechanical but is a good one for gaming. But the upper limit stays 2000. I've decided to go with your suggestion anyway as I don't know a lot about keyboards. I went to this year's techfest at IIT Bombay where I saw a stall by Circle gaming. They were selling gaming keyboards and mouse at a Good discount. I was really tempted to buy the Matalloit-X being sold for ₹1500 instead of ₹3500 but

then I realized it was semi mechanical. Now, see here's where I need your help. I don't know if it actually being a membrane keyboard but with mechanical feel is a good thing or not. So I didn't buy it and decided to ask you. And even though I've heard the name Circle gaming a few times I don't really know whether or not it's a good

The Logitech G413 Carbon

brand and how the keyboard is actually gonna turn out. But I trust your opinion so I'll buy the keyboard YOU say is a good one even if I've never heard of the manufacturer. I know you'll guide me in the right direction. Thank you Digit.

—Parth Ghumare

A Hey Parth, A keyboard that is mechanical, well-built and has customisable RGB, is an impossible find. At the ₹2000 price point, you're going to get the same thing from all manufacturers. Good keyboards at this price point would be membranes that are focused on build quality. Getting a good mechanical would cost a little more than twice this amount. If you want a good keyboard, with just a single colour backlight then the Logitech G413 is a really good one for ₹5,000. At your quoted price of ₹2000, you aren't going to get what you want. [4](#)
