Corsair M65 RGB Elite

A step-up in performance

If you've been spending a good amount of time looking at gaming mice over the years, you might possibly know about the Corsair M65 mouse and its iterations. It had a unique design when the sniper button was introduced years ago. Although it might not have been useful to you, it did serve a new way of playing FPS games. Now, they've given the M65 series a refresh with a new custom optical sensor in the M65 RGB Elite.

Features and accessories

All the basic features expected in a premium gaming mouse are present on the Corsair M65 RGB Elite. Corsair upgraded the M65 Pro RGB with a new custom optical sensor in the form of the PMW3391 that performs way better than average. It can go up to a maximum of 18,000 DPI and can be increased or decreased through 1 DPI steps. You can cycle through a maximum of five DPI levels using the buttons on the top of the mouse, where the values can be customised using iCUE.

Another aspect that was changed was the minimum weight, so FPS gamers who love a lightweight mouse will be delighted to know that the M65 RGB Elite can now be reduced to only 97g without the weights. Previously, the M65 Pro RGB weighed at a minimum of 115g. The sniper button gives the M65 mouse its identity and it has been given an update only with respect to its position.

Finally coming to the regular bells and whistles, the mouse supports RGB lighting in two zones – the Corsair logo and the scroll wheel. Lighting effects can be controlled using iCUE. Other settings such as surface calibration, macro recording, polling rate, firmware upgrades, custom profiles,

onboard profile storage (one profile) etc., are also enabled by the software.

Build quality and design

Sporting an unconventional design always, the M65 RGB Elite is an ergonomic mouse. It might look uncomfortable to hold the mouse, but a palm grip feels fine. If you have medium to large hands then you could comfortably do a claw grip as well. Because of the different design, it's advisable to actually try it out before making a buying decision. However, it all comes down to personal preference at the end and the weird design could be unsettling for you.

While the majority of the parts of the mouse are made from plastic with different finishes and density, the main frame of the mouse is made of anodised aluminium. This drastically improves the durability and makes the entire frame rigid.

Considering the unconventional design of the M65 series, it was definitely a difficult task to accommodate all the components inside. With some improvisation, separating the optical sensor from the main board did the job quite well. It's also safe to say that build quality has been quite impressive throughout the mouse.

Sensor performance

Having already tested the PMW3391 optical sensor on the Corsair IRONCLAW RGB, we weren't really expecting anything different. Most of the parameters displayed similar performance. The noisy variance that we noticed previously was also seen in this mouse. In Enotus Mouse Test, we recorded high smoothness as expected. This was another aspect present in the IRONCLAW RGB, stemming from the same issue.

Coming to real world testing, this noise observed in the graphs didn't really affect gameplay. We were comfortably able to play FPS games and land headshots without noticing any lags or input issue. We also didn't notice any positive or negative acceleration, nor was angle snapping present by default. Since the mouse is dedicated to FPS players, a lower lift-off distance would have been more favourable for them.

Verdict

Corsair has retained all the features and the signature build quality that ensured the M65 lineup continues its legacy. With time, the software utility has also improved, making it easier to control all the settings on the mouse including the RGB lighting effects, macro recording, surface calibration, custom profiles and much more. The Corsair M65 RGB Elite is a brilliant mouse possessing all the premium features with superior build quality. If you're looking for a gaming mouse specially for FPS games and don't mind spending the extra money that the Corsair M65 RGB Elite entails, choosing this one is a decision that you will not regret.
