NVIDIA RTX 2060 Founders Edition

This is not a 60-class card

The latest member of the new NVIDIA RTX family is the mid-tier RTX 2060. Having managed to incorporate a whole new paradigm with the hardware-accelerated Ray Tracing feature, the new Turing architecture based NVIDIA cards were marketed with a lot of emphasis on the ray tracing and DLSS features. The RTX 2060 would be the at the bottom of the RTX stack with upcoming entry-level cards not shipping with any RT cores.

NVIDIA RTX 2060 FE

The NVIDIA GeForce RTX 2060 is based on the same TU106 GPU that powers the RTX 2070. Up until now, with all previous generation of NVIDIA graphics cards, the 60-class of graphics cards always had a different GPU. This time around, it seems that we're getting a cut down variant of the RTX 2060's bigger brother. Since this is an RTX card, we get 30 RT cores which is only six cores lesser than the RTX 2070.

Another thing to note is the pricing, we are looking at a 60-class graphics card which is \$150 dollars more expensive than its predecessor. That's a huge jump especially given that the 60-class graphics cards are the sweet spot in NVIDIA's lineup. This is why 15.39% of Steam users have the GTX 1060, a good 6% lead over the second most popular card. Suffice to say, the RTX 2060 is not going to end up as the favourite among gamers.

Performance

We ran the usual set of synthetics on the RTX 2060 which includes a host of benchmarks from 3DMark, Unigine, Compubench and a few others. The part that stands out about the numbers is the relative performance within the family and how it has scaled since Maxwell. Our old benchmarks peg the FireStrike scores of the GTX 960 to

Price
₹31,000

that of the GTX 980 at a ratio of 1.95. Which meant that the 80-class card would be roughly 2x better than the 60-class card in performance. Now if we are to see how the RTX 2060 compares with the RTX 2080, then the same metric produces a factor of 1.26. Essentially, the RTX 2060 is a lot closer to the RTX 2080 than how the previous generation of graphics cards used to be.

We see a very linear scaling of performance across the RTX family of graphics cards. For 1080p gaming, the RTX 2060 just about equals the GTX 1070 Ti in practically all DirectX 11 and DirectX 12 video games. The same trend can be seen even when the resolution is scaled higher. With the 10-series cards, we see quite a bit of frame rate drops at higher resolutions. You can also see how the RTX 2060 frame rates are closer to the RTX 2070's frame rates. With the 10-series cards, this delta is much higher. What we're looking at is simply not a 60-class card.

Pricing

The NVIDIA RTX 2060 Founders Edition is priced at ₹31,000 and is bundled with a free game. You can pick either Anthem or Battlefield V if you get the RTX 2060 FE. All partner cards don't get the free games from

PERFORMANCE.....76
BUILD75
VALUE FOR MONEY....90

NVIDIA though they are absolutely free to offer bundles themselves. Pricing for the card on NVIDIA's own store is lower than what their board partners are offering at the moment. So NVIDIA has the clear advantage and there's

practically no reason to get a partner card unless they have a value proposition that's better than what NVIDIA is offering.

Verdict

NVIDIA's RTX 2060 is a welcome addition to the RTX family of graphics cards. It's got quite the performance upgrade over the previous generation GTX 2060 and comes with a price tag to match. One could argue that the premium is for the RT cores and they'd be right but the 60-class of graphics cards have always been about catering to the intersection of affordability and performance. The RTX 2060 gets the performance part right but is nowhere close to being affordable, not at all for the Indian market.
