Fuchsia runs on Pixel 3

Google's Fuchsia OS can already run on Google's latest Pixel 3 devices however it's hardly recommended to do so. <https://digit.in/feb19-14>

Lenovo ThinkPad X1 Extreme

Heavy on performance and price

Lenovo, the ThinkPad brand's guardian since 2005 seems to have let lightness and slimness take a back seat with the X1 Extreme. However, does the new ThinkPad offer enough to merit a buy? Let's find out.

Build and design

Like its X-series brethren, the ThinkPad X1 Extreme has a large all-black graphite/carbon-fibre top cover that's both pleasant to look at and hold, with sufficient grip, and so is the aluminium alloy base.

Opening it requires considerable force. It has a glossy 15.6-inch display with noticeably slim bezels around it. The X1 Extreme uses a single IdeaPad-inspired hinge that spans almost the entire width of the display. Thanks to that, the display stands erect even when the device is shaken about.

Display, audio, and IO

To the naked eye, it feels as if the display colours are oversaturated. The screen is otherwise bright enough for use in sunny outdoor spots like balconies. The touch latency is an issue; the X1 Extreme would take a second or two to respond to sudden swipes and taps, especially while scrolling.

Audio from the Lenovo ThinkPad X1 Extreme's two downward-firing speakers is loud enough for playing music and movies at home and at work. The X1 Extreme sticks to the good old proprietary Lenovo power port because it consumes 135W of power. Along with the standard ports mentioned in the specs, you get a network extension port for the included LAN dongle, a smart card reader, a four-in-one memory card reader, and a Kensington lock slot. The fingerprint scanner on the review unit worked swiftly during sign-ins. Face unlock worked accurately three out of five times.

₹2,91,633

Keyboard and touchpad

While the numpad has been dropped, the spill-proof keyboard is signature ThinkPad, with the right amount of travel, pitch, and backlighting brightness. But Lenovo has fiddled with the resistance of the keys, making them harder to press than on other ThinkPad models.

The ThinkPad X1 Extreme's touchpad uses a combination of Windows 10's precision drivers and Synaptics software to provide a mostly pleasant touchpad operation. The X1 Extreme also gets the good old TrackPoint and a middle mouse button option, which work smoothly.

Performance and gaming

On benchmark tests, the ThinkPad X1 Extreme fared well enough to beat models like the Dell Inspiron 7572 and the Acer Swift 5 but not well enough to beat the Lenovo IdeaPad 530S in terms of overall score.

The review unit performed everyday tasks with a great deal of ease, even when put through multiple CPU-intensive activities. Gaming wasn't ideal with Doom clocking 20fps@4K and 60fps@FHD. While running

Metro: Last Light, at no time did the frame rate touch 30 frames per second. The temperature of the CPU package rose to nearly 80 degrees Celsius every now and then, especially during app installs. Luckily, it wasn't felt on the base of the device. But the cooling fans, which turned on every few minutes, were noisy.

Battery

Under significantly heavy load, the battery dipped from 100 to 26 percent in four straight hours. Considering the load it had, it's not a bad score. Charging back to near 100 happened in 1 hour, 25 minutes, which is pretty swift. On our standard battery benchmark test, however, the X1

Extreme scored an average of 3 hours, 35 minutes.

Verdict

The Lenovo ThinkPad X1 Extreme is definitely for you if you're looking for a business machine that manages to find a balance between power and portability. It's a fine tool for image and video editing. Its massive powertrain inside is capable of handling a lot of tasks at the same time, heavy or light. Its 4K display, though oversaturated in terms of colour reproduction, is bright and allows for a great level of detail.
