

iPhones 'Made in India'

Apple is reportedly planning to make iPhones X, XS, XS Max in India to reduce its dependence on China. <https://digit.in/feb19-19>

Phone with no Ports!

The Meizu Zero is a smartphone with no ports or buttons, with only holes for a microphone and a tiny reset button. <https://digit.in/feb19-20>

Picking the best, sans wires

Arnab Mukherjee | arnab@digit.in

The world of audio is quite subjective, and while many still hold on to their wired headphones and earphones, users have made the switch to wireless. The quality of wireless audio has seen huge gains over the last few years. In fact, major brands are releasing wireless versions of their established wired audio devices, which showcases a willingness to put brand value on the line. Today we're talking about a comparatively recent audio category that has almost no legacy – true wireless IEMs. Some seriously unique and useful features, making it even more difficult to pick one among the lot. That brings us to this test. We've picked some of the best True Wireless IEMs and pitted them against each other across categories.

BRAGI THE DASH PRO

Build and design: The Dash Pro isn't Bragi's first true wireless IEM and that is evident in its design. They might look a bit bulky and daunting, but they fit right into your ear canals, especially when you're using the right combination of FitSleeves and FitTips. Not only do you get a build that you can swim with, but it also features tracking for your swim sessions along with other activities. The Dash Pro features touch input, which works like a dream. Our only issue with the Dash Pro's build is, in fact, not with the IEM but with the case. It is quite bulky and heavy, not something you would want to carry in your pockets. However, that very same case grants these buds a cumulative battery life of 25 hours, so hey, we're not exactly complaining here.

Features: The Dash Pro breaks the mould for True Wireless IEMs and it wouldn't be wrong to call these the smartest earbuds out there. When it comes to controls, with a combination of touches, taps and swipes, Bragi has most use cases covered, including additional features of audio transparency and Windshield. Using audio transparency lets you listen in to your surroundings without having to take off the IEMs, and it also works perfectly fine. Oh, and did we mention the fact that you can control the Dash Pro by moving your head, using something called the 4D menu?

Performance: In our usage period, the Dash Pro gave us no connectivity issues save for the initial pairing, which took a while. Due to the slew of features it offers, you might feel a bit
