

Gaze Tray

Funding: ₹2,277,534 INR raised of ₹353,907 goal by 441 backers.

Link: <https://dgit.in/GazeTray>

Gaze Labs isn't a new name either in the world of crowdfunding or in the world of handy life-style products. Their latest offering, the Gaze Tray, is the wireless charger that Apple users have been waiting for since the announcement of the AirPower. Designed to blend into a home rather than stand out, the Gaze Tray reflects a rising design movement in technology where it is modelled to respect the way you furnish your home rather than challenge it. The Gaze Tray can

charge five devices at the same time. Namely, the Phone charging platform (Qi standard) on the left of the tray, followed by an Apple Watch charger (magnetic) located centrally, along-

side an AirPods charger (Qi standard) cutout with a free AirPods charging case on the lower right corner and 2 USB ports (for wired devices) on the side. Gaze Labs wants you to use the extra room to organise other stuff that you might be carrying on your person, like jewellery. There are three helpful indicators that show the status of each wirelessly charging device. The tray is available in three finishes – artificial leather and matte rubber-coating, each with four colour options and even a gold Chrome finish.

Hexbot

Funding: US\$ 307,609 pledged of US\$ 50,000 goal

Link: <https://dgit.in/Hexbot>

With the aim of bringing an industrial robot to your desktop, Hexbot is a robot arm that looks the part yet manages to be desktop friendly. It comes with 0.05 mm repeatability and 0.1 mm precision here. The Hexbot supports a number of 'End Effectors', i.e. arm extensions that grant it varied capabilities – a pen holder, laser engraver, suction cup, soft gripper and a 3D printer. Each of these extensions can be attached with a simple push-click action, no screws involved. With a speed of up to 500mm/s and payload capacity of 500g, the Hexbot can be fast and strong enough to fulfil a

number of use cases. All that without being noisy thanks to the redesigned drive circuit and power method, that has reduced the motor noise down to 37dB, the same noise level as a quiet night.

The developers have also integrated Blockly into the platform which would allow people with less coding experience to program the Hexbot. Experienced developers can go for the API that allows them to control Hexbot in Processing, Python, and G-code. An included 3.5 inch touchscreen controller with SD card support removes the need for the Hexbot to be always connected to a computer. What's more? The Hexbot can collaborate with Linear Rails and Conveyor Belt (purchasable on Kickstarter separately) and vision recognition tools and even other Hexbots to bring an industrial production line right on to your desktop.

Zümi

Funding: US\$ 51,670 pledged of US\$ 50,000 goal

Link: <https://dgit.in/Zumi>

The topic of self-driving cars and the possibility of them landing upon real roads have been around for quite a while now. However, finished models are yet to be seen on real roads. With devices like Zumi, a mini self-driving car toy, they don't have to stay that way.

Creators of Rokit Smart and CoDrone, Robolink is no stranger to successful crowdfunding. With the Zumi, they seem to have another hit on their hands with the project being successfully funded with 52 days to go for the campaign completion at the time of writing. The main aim of Zumi is to help people learn broad AI

technology that is normally unapproachable. With the help of the step-by-step tutorials, you will be able to train Zumi to navigate a mini-map of your making in under an hour. Due to its prowess and unique features, Zumi won the CES 2019

Best of Innovation Award in the Robotics and Drone category.

Zumi can be trained to figure out routing and arrive at optimal results. Due to an

onboard Pi camera, Zumi can also identify objects and take decisions accordingly, as programmed by you. Using the same tech, Zumi also supports hand gestures and facial recognition. This programmable toy car uses TensorFlow and OpenCV, both tools used by full-time autonomous car professionals. Beginners can choose to use a web-based simple IDE, however, experts can take it to the next level and code their own TensorFlow and Keras code to carry out more outlandish tasks. Over multiple runs across the same maps, Zumi also learns to optimise the route better. In terms of hardware, the Zumi packs a Raspberry Pi Zero, an Arduino-compatible PCB, sensors like infrared, gyrometer and accelerometer, and can pull off an hour of usage on its batteries. Get one even if you're too old to be playing with toy cars. Delivery is expected by May 2019.
