

Deep Mind AI conquers StarCraft 2

Google's DeepMind AI beats two pro StarCraft players in two series' in December, the companies jointly announced today. <https://dgit.in/feb19-45>

Gas detecting Apple device

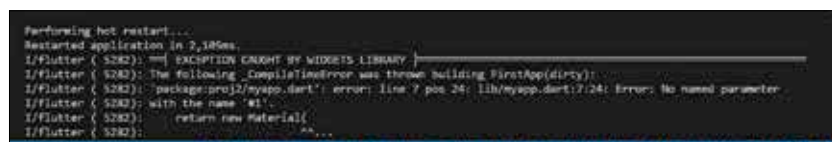

Latest patent granted to Apple indicates a future iPhone with gas detection sensor to warn user of their surroundings. <https://dgit.in/feb19-46>

The first run of our app

Having done this much, let's go back to the point where we've just stepped into the inkwell widget. We are going to make something aesthetic here with the use of onTap function. With this, everytime that we tap into the screen, the screen shall give us the fancy tap animation that looks like an oval texture swipe. We may also provide some activity to be done everytime the screen is tapped, as shown here: <https://dgit.in/Flutter3>.

Well, now that we have quite a handful of stuff coded, we can run the application by typing out **flutter run** in the terminal.

Any change can be reflected by doing a hot restart by pressing R

For every other app reload, we can press **R** to do a quick hot reload without reloading the state of the app, which can be done if we do a hot restart command with a **R**.

And this brings us to the end of this little project that we've been trying to build. In brief, this code imbibes a material type design, of course very simple, and prints some text. Title, application bar and in the body. The concept of nesting is explored a bit that offers insight on what Flutter treats as a child and children. A fancy UI function and

a bit of playing around with the text. Of course, Flutter has a lot more to offer.

Having done this much, let's go finish it up by writing our main function as shown here: <https://dgit.in/Flutter4>.

At the very first we import our material class that we've used and we're going to use the MaterialApp widget here in the main (unlike the Material that we've used in **myapp.dart**)

The rest of it is simple enough. We import myapp.dart as well. Inside our main, we use the runApp function to run this application. Since we haven't defined yet what our app is going to be, we instantiate a new object of the

MaterialApp widget which is going to wrap up our FirstApp widget inside the home property.

Feel free to check out <https://flutter.io/docs> and immerse yourself. We are positive that you are going to find it very fascinating easy and beautiful to work with. 📌
