

and Actions, scroll down and you should see a list of applications that are allowed to show notifications. You can toggle the setting next to each application, to make sure that you only get the notifications that you want to see.

07 Get Windows Hello

If you want to incorporate the facial recognition feature onto a Windows desktop, then you can try Windows Hello. Since Windows Hello only works with select hardware, you will need to get an Intel RealSense camera and a fingerprint reader to enable Windows Hello on your desktop. Just ensure that your CPU is a 4th Gen Haswell or later to enable this feature.

08 Snap Windows

If you work with multiple windows, it can be time consuming to use the mouse to position the windows on the display. A

convenient keyboard shortcut to use is the **[Windows] + Arrow** (direction keys). This lets you snap the current window to the right or left side of the screen. Using the up or down keys after snapping to a side, resizes the window to a quarter of the screen. These shortcuts

work very well when combined with **[Alt]+[Tab]**.

09 Find Large Files

Use WinDirStat, a well known storage analysis tool that is smaller than an MB, to identify how the storage space on your system is being used up through helpful reports that are colour coded and organised. The largest files are represented as big, single colour blocks in the graph and clicking on them shows you which file it is.

10 Sketch

Windows 10 allows users to sketch on the screen, use a sketch pad, and place sticky notes on the desktop. To quickly bring up the menu where these features can be accessed, press **[Windows] + [W]**.

11 Biometric Scanner

You can lock your computer with biometric security. You need a fingerprint scanning device to do so. One of these can be picked up from online shopping portals, for ₹1,500 and upwards. The fingerprint scanner is connected through a USB drive.

12 Dynamic Lock

Using the Sign-In Options in Settings, you can set a Dynamic Lock. This allows you to pair a device with your machine, and the PC can be used only if the paired device is nearby. A smartphone or a fitness tracker can be used for the Dynamic Lock. If you need to do this for a desktop, you can do so with a Bluetooth USB dongle.

To edit the sensitivity of this lock:

1. Create a registry key named **HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\NaAuth**
2. Within that key create a **DWORD** value named **BluetoothRssiMaxDelta**
3. Set the value to whatever number makes sense for the situation. You can experiment to determine what works for you. (Hint: To speed up the process, enlist a friend or family member to watch the PC while you walk away with the phone.)

13 Shake

If you have a lot of open windows, you can close all of them at once by just shaking the current window that you are working on. Just grab the title bar using the mouse and jerk it around to minimise all the open windows in the background.

14 Old Control Panel

The new Settings panel has a easy to understand interface, but if you are more comfortable with the control panel, or need to change some advanced settings, then that option is still available in Windows 10. Just press **[Windows] + [R]**, type "control" press **[Enter]**.

15 Hide a drive

All you need to do to hide a drive is: Press **[Windows] + [R]** to open the run dialog box, type "gpedit.msc" and press **[Enter]**. The Local group policy editor will open, go to **User Configuration > Administrative Templates > Windows components > File explorer**. Here find the "Hide these specified drives in My Computer" option and double click on it. When it opens, it will probably be set to "Not Configured". You should click on "Enabled" to enable the option. Under the "Pick one of the following combinations" header you should see a drop down with "Restrict all drives" selected. Go through the options and select the one you want. For example, if you want to hide the D drive only, just select "Restrict D drive only" then click **Apply** and then **OK**, and your D drive should now be hidden. You will have to repeat the steps mentioned above to get back here to be able to unhide the drive later on.

16 Safe with Sandbox

Windows is playing around with a new Sandbox feature that allows you to fire up a virtual environment to test out new software or open files which you believe to be unsafe. You will need the latest Insider Preview build installed and then turn on the Windows Sandbox feature under "Turn Windows features on or off". Just press **[Windows] + [R]**, type "optionalfeatures" and press **[Enter]**. Most modern CPUs come with virtualisa-
