

also have to install a Linux distribution. This is how you do it. Another thing to note is that this feature is only available for the 64-bit version of Windows 10 and not the 32-bit version. With that clear, head over to **Control Panel > Programs > Turn Windows Features On or Off**. Scroll down to find **Windows Subsystem for Linux** and enable it. Click on **OK** and then on the **'Restart Now'** button for the feature to take effect. Restarting your PC will install and enable the feature. Now, you must install a Linux distribution and for that, you will have to visit the Microsoft Store. Search for 'Linux' in the search bar and you'll be presented with known Linux distributions including Ubuntu, Debian, Kali Linux, etc. Select the appropriate distribution and click on 'Get' to start the download. After the download is complete, open it from the Start menu and it will begin installation. On completion, it will ask you for a username and password just like any regular Linux distribution. You're all ready to start using the Bash shell on Windows. This feature is limited to command-line applications and not all of them will run successfully.

27 Remove 'Quick Access' view

When you open up File Explorer, you're taken to the Quick Access tab that shows all the recent folders and files you had accessed. This is a new addition in Windows 10 and if you don't like it, then you can revert back to the same old My Computer or This PC starting page. Open File Explorer and head over to **View > Options > Change folder and search options**. The Folder Options window will pop up and you'll see an option labelled **"Open File Explorer to:"** right on the top. Open the dropdown list and select 'This PC' and click on 'OK'. Henceforth, whenever you open File Explorer, it will begin at the This PC page.

28 Storage analysis

Although you can use **WinDirStat** for a more detailed representation of your storage

drive's utilisation, Windows 10 has its own storage analysis tool built-in already. Head over to **Settings > System > Storage**. All your drives will be listed here. Clicking on them will open up the kind of files that are occupying that particular drive. For eg, if you open your C drive that has your Windows installation, it will list down the usage based on the type of files such as Apps and games, Temporary files, System and reserved, etc. This is the same for all the other drives as well where you can get a clue of how much space is being occupied by videos, documents, pictures, music, etc.

29 Screen record any program

If you've been playing video games on your PC, then you must have come across the Xbox Live pop-up that lets you record your gameplay and even broadcast it. It would usually pop up whenever a game was launched and it can be manually invoked using **[Windows] + [G]**. Called the **Game Bar** menu, you can record any active window or program running on Windows. Say for example, you want to record your web browser activity on Google Chrome. Just launch the game bar with **[Windows] + [G]** and when it prompts you with a question **"Do you want to open Game Bar"**, select **"Yes, this is a game"**. Tap on the record button and it will ask you to enable recording features. After enabling, you can record all your activity on Chrome. Remember, it doesn't record your whole desktop, just the application it was started in. So, if you're recording your Chrome activity, even if you switch to another program, it will continue recording the Chrome window and your mouse pointer movements.

30 Share a VPN over Wi-Fi

Start by running a wireless device. This can be a USB wireless adapter or a built-in interface. Make sure the device supports hosted networks. Consider the name and password for your shared network. Once you have created and started the hosted network, you'll have to bind the VPN connection to it. Once that is done, execute the following steps:

1. Right-click on the connected network adapter.
2. Click on 'properties'

3. Click on the 'Sharing' tab
4. Tick the box against 'Allow other network users to connect through this computer's internet connection'
5. Click on 'home networking connection' and select 'Microsoft hosted virtual adapter' (it will be LAN Connection XX. XX stands for the SSID you chose for the hosted network)
6. Click on 'OK'

Once you have created and activated the hosted network, connect to it like you would from any device that supports a wireless connection."

31 Playing 3D video using VLC

After making sure you're running a side-by-side (SBS) video file. Go to **Tools > Effects and Filters**. Then click on Video Effects tab and in this section click on Advanced tab. Under advanced tab enable anaglyph 3D, and that's it!

32 Clean up "Open With"

When you right click on a file in Windows, you get the option to Open it with the default program, or check the Open With submenu to choose another program that is capable of opening this file. This capability is associated as a registry entry that you can edit according to your preference, maybe to streamline the options. After all, why would you want to open a PDF in Microsoft Edge? To do this, open the Registry Editor by pressing **[Windows] + [R]**, typing **'regedit'** and press **[Enter]**. Once the registry editor is open, navigate to **Computer\HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Explorer\FileExts**. Here you will see a list of the file extensions that Windows supports. Clicking on any of them will open a subtree where one folder would be **OpenWithList**. Delete any key from here that corresponds to the program that you want removed from the Open With submenu.

33 Use "Copy To" and "Move To"

Do you move files around a lot? We sure do. The standard option that you get when you right-click on a file is "Send To" which is not always help-
