

ful. However, there's a simple registry edit that you can perform to add "Copy to folder" and "Move to folder" context menus to the right-click menu. In the registry editor, go to **Computer\HKEY_CLASSES_ROOT\AllFilesystemObjects\shell\ContextMenuHandlers** and right-click on **ContextMenuHandlers**. Select **New > Key**, name it "CopyTo", and change its default value to {C2FBB630-2971-11D1-A18C-00C04FD75D13} – (include the curly brackets). Similarly, create a "MoveTo" key and change its default value to {C2FBB631-2971-11D1-A18C-00C04FD75D13}. Now, when you right click on any file, you'll get these options, clicking on which will take you to a Folder selection pop-up window. Selecting a particular folder will copy or move the file to that folder, depending on the chosen action.

34 Set a video as your wallpaper

This is a nifty little trick that allows you to set a video as your desktop background. This works with videos of any length. Open up VLC, then go to **Tools > Preferences > Video**. Then under **Output**, select, **DirectX DirectDraw Video Output**, then click on **Save**. Now, select the video that you want to play

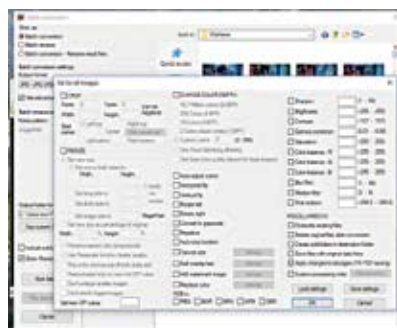

and set as your desktop background. This can be any video that you have saved on your computer, or even a video from the web. To use an online video, go to **Media > Open Network Stream**, and copy paste the URL. The method works with YouTube videos, for example. Now, play your video on loop, and put the VLC instance on mute. Navigate to Video and select Set as Desktop Wallpaper. That is it, now you can [Alt] + [Tab] and continue working, while the video continues to play as the desktop background.

35 Batch edit photos

You might have to batch edit multiple photos for various reasons, from

sharing with people on social media, to just renaming them, to uploading them to a blog or image sharing service. To do this, you do not need a paid image editing tool. IrfanView does the job very well. After installation, start up the software and just hit [B] to bring up the batch processing menu. It can also be found under **File > Batch Conversion/Rename**. Select the input folder, and check **Used Advanced Options**. This will bring up a window with options to crop, resize, add watermarks and colour correct as well. If you are repeatedly going to use

the same settings, you can even save your settings and load them from this interface. Once you have selected the options, click on **OK**, and select the output folder. Click on **Start Batch** to initiate the process.

36 Save a YouTube video

Now there are many third party tools and web sites that allow you to save YouTube videos, but these typically shove ads in your face, and the software may come loaded with unwanted extras. There is a simple way to directly download YouTube videos from their servers. Just go to VLC, select **Media > Open Network Stream**, and key in the url of the YouTube video. Then, go to **Tools > Codec Information**, and look at the **Location** box. This is a direct link to the resource, copy the entire text, and paste it in your browser. You can now simply right-click and save the file.

37 Clip a video

VLC can also be used to save clips or portions of a video, and this works on

videos on YouTube as well. The resulting clips can be used for a variety of reasons, from inserting into presentations to using them as desktop backgrounds. Open up VLC and under View, select **Advanced Controls**. Then open up the video you want to clip, from a network location (web) if necessary. Play the video, and click on the red record button that appears on the bottom left corner. A blue shadow around the button will indicate that the clip is being recorded. Click on the record button again to stop recording. The resulting clips are saved in the Videos folder of your Windows profile.

38 Clip videos without rendering

When you edit a video, the content is typically rendered to save as a new file. When working with HD or 4K videos, this rendering can be very time consuming. There is a simple way to create small clips out of HD videos, without having to render them. The software for this is called Avidemux. Open the file within the software, and

select the portion you want to cut, and not the portions you want to keep, using the A and B marker buttons. Using the B marker without a start selects everything before the point in the video, and using an A marker without an end selects everything after the point within the video. To clip a typical video, you just need to select a B marker, go to **Edit > Cut**, then select a point for the A marker
