

and go to **Edit > Cut**. Then just hit **File > Save**. Now, some video codecs use keyframes, after which subsequent frames only store the data on the change in comparison to the keyframe. If you do not cut at a keyframe, your video could get corrupted. To prevent this, make sure that the point at which you cut the videos is located at a keyframe. In commonly used formats such as MP4, there are several keyframes within a single second, so it should not be difficult to find a keyframe very close to the point at which you want to cut. You can navigate to the keyframes easily by pressing the << and >> buttons.

39 Quickly make sharable videos

You can make sharable videos from the photos and videos that you have saved on your computer. This works a bit like GoPro's Quik app. Just open up the Photos app, and click on the

New Video then select the Automatic Video option. You can then just select multiple items from your collections, and Windows will generate a video for you, complete with titles, transitions and background music. You can share this video on social media platforms right from the Photos app itself. If you do not like the video, just hit on the Remix button, and Windows will change the pacing, titling style, and background music, and generate another video. This is a nifty little feature that saves a lot of time when it comes to sharing say your family vacation photos, or marathon gaming sessions.

40 Edit videos

You do not need to install a third party video editing application. The Photos app does a pretty good job of basic video editing, and is similar to Adobe Spark,

which is an online video editing app oriented towards making sharables for social media. While not containing as

many preset visual options as Spark, photos is much faster as it is not a web app, and does almost the same job. Plus, you can export videos without having to get rid of the watermark, if you are using the free version. So if you want to promote your business,

or share a video about your family vacation, the Photos app actually is a great tool to use. Open the Photos app, navigate to the Video projects tab and select the assets that you want to make the video with. Once a new video project is created, you can import additional photos and videos. In the timeline view, you can add animations for each photo, to give them a sense of motion. The Audio menu allows you to record a voice over narration, and even provides you with a selection of tracks to set as the background music. You can add titles using the Text button, and the provided presets are really cool. You can also add filters to each photo or video, if you so choose. Once you are satisfied with your work, click export or share to save the video file, or directly upload to linked social media channels.

41 Pick a Star

When creating an automatic video, you can tweak the settings so that the

action follows a particular person within the video. Once you import the videos and photos to make an automatic video, Windows will automatically detect all the people and show a thumbnail. To use the Pick a Star feature, just select one of the people. The feature can be used to highlight a friend, a child, or yourself. For the feature to work as expected, the faces of the people selected should be clearly visible.

42 Improve sound quality

You can improve the quality of sound on movies and games, to enhance the overall experience. According to Microsoft, spatial sound is an improvement over surround sound, where the individual sources of sound appear to move in a virtual three dimensional space around your head. In the end, the user gets a more immersive experience. Windows supports two

spatial sound formats for headphones, Windows Sonic and Dolby Atmos. If you have a Home Theatre system that supports Dolby Atmos, then you can choose a third format, Dolby Atmos for home theater. Just right-click on the volume button, go to Spatial Sound, and select either Windows Sonic or Dolby Atmos to enable this feature.

43 3D Effects

You can add 3D effects to your photos and videos using the video editor in the Photos app. There is a huge list
